PREFACE

Assessment of agricultural production in Nigeria is a core mandate activity of NAERLS. The 2018 wet season Agricultural Performance Survey was conducted from 2nd to 9th September. The fieldwork was done in collaboration with the following organizations: 36 State and FCT Agricultural Development Programmes (ADPs); Federal Department of Agricultural Extension (FDAE), FMARD; States Ministries of Agriculture in 36 states and FCT; National Bureau of Statistics (NBS); Nigerian Meteorological Agency (NIMET); Planning and Policy Coordination Department (PPCD), FMARD; Federal Department of Fisheries and Aquaculture (FDFA), FMARD; Federal Department of Agriculture (FDA), FMARD; Federal Department of Animal Production and Husbandry Services (FDAHS), FMARD; Department of Monitoring and Evaluation, Federal Ministry of Budget and National Planning (FMBNP); Deutsche Gesellschaft Fur Internationale Zusammenarbeit (GIZ) GmbH- Nigeria; World Food Programme, Abuja; Institute of Agricultural Research (IAR), ABU, Zaria; Institute for Agricultural Research and Training (IAR&T), OAU, Ibadan; National Animal Production Research Institute (NAPRI), ABU, Zaria; National Institute for Horticultural Research (NIHORT), Ibadan; National Institute for Oil Palm Research (NIFOR), Benin- City; and Nigerian Hydrological Services Agency (NIHSA), Abuja.

Nineteen teams visited 148 LGAs in 36 states and the Federal Capital Territory (FCT). A monitoring team of six persons, one per geo-political zone monitored the survey. A special team further visited six selected states (Jigawa, Kebbi, Adamawa, Kogi, Niger and Delta) to assess the impact of floods on food production due to widespread incidence of floods after the fieldwork.

The survey report provides an insight into annual cropping season with emphasis on food production, crop pests and disease situation, market situation, commodity prices, agro-meteorological conditions, and agropastoral conditions across the country. The survey also provides insights on performance of policy thrust as well as progress made on Special Interventions and Programmes on Agriculture by the Federal and states Governments. The outputs of the evaluation exercise were put together into an executive summary and national report, which have been circulated to all states, relevant agencies and other stakeholders. The report provides findings and data that can guide policymaking and focused research in Agriculture.

In an effort to improve the quality and reliability of the data generation, NAERLS continues to expand its range of partners for inclusive data capture and analysis. The Institute works on developing the capacity of key partners in data collection and management.

Sincere appreciation goes to farmers and farmers' groups, officials of the State Ministries of Agriculture, State Agricultural Development Projects (ADPs), National Agricultural Research Institutes and Agencies, State and Local Government Officials across the country who contributed to making this work a success. We are highly indebted to the Honorable Minister of Agriculture and Rural Development, Chief Audu Ogbeh, OFR and the Minister of State, Senator Dr. Heineken Lokpobiri for their untiring support. In the same vein, we are sincerely appreciative of the NAERLS Board Chairman, the ever-supportive Vice Chancellor of Ahmadu Bello University Zaria, Prof. Ibrahim Garba.

As usual, we welcome comments and suggestions for the improvement of the survey.

Prof. M. K. Othman

Executive Director, NAERLS

EXECUTIVE SUMMARY

The 2018 wet season agricultural performance survey was conducted between 2nd and 9th September 2018. The survey was carried out by the NAERLS in collaboration with the following organizations: 36 State and FCT Agricultural Development Programme (ADPs); States Ministries of Agriculture in 36 states and FCT; Federal Department of Agricultural Extension (FDAE), FMARD; National Bureau of Statistics (NBS); Nigeria Meteorological Agency (NIMET); Planning, Policy and Coordination Department (PPCD), FMARD; Federal Department of Fisheries and Aquaculture (FDFA), FMARD; Federal Department of Agriculture (FDA), FMARD; Federal Department of animal Production and Husbandry Services (FDAHS), FMARD; Department of Monitoring and Evaluation, Federal Ministry of Budget and National Planning (FMBNP); Deutsche Gesellschaft Fur Internationale Zusammenarbeit (GIZ) GmbH- Nigeria; World Food Programme (WFP), Abuja; Institute for Agricultural Research (IAR), ABU, Zaria; Institute of Agricultural Research and Training (IAR&T), OAU, Ibadan; National Animal Production Research Institute (NAPRI), ABU, Zaria; Nigerian Institute for Horticultural Research (NIHORT), Ibadan; Nigerian Institute for Oil Palm Research (NIFOR), Benin- City; and Nigerian Hydrological Services Agency (NIHSA), Abuja.

A participatory approach to the survey combining qualitative and quantitative techniques were employed in data generation. These included consultations and dialogues with stakeholders, questionnaire survey, Participatory Rural Appraisal (PRA) and interviews. Nineteen multidisciplinary teams of three scientists each, carried out the exercise across the 36 states and the Federal Capital Territory (FCT). In every state, two ADP zones were visited. In each zone, two LGAs were selected and one community selected per LGA. In each community, five farmers were interviewed and focus group discussions held. Extensive discussions were held with the ADPs staff, ministries' officials and staff of other relevant agencies. Final wrap-up sessions to validate the data generated and findings were held at the end of each state visit with officials of the State ADP and Ministry of Agriculture. Primary and secondary data were collected and analysed using the Statistical Package for the Social Sciences (SPSS v23). Appropriate statistical procedures for description (frequencies, percent and means) were used. Relevant indicator was computed and summarized using validated methods. Forecasts of 2018 crop yields involved the use of adjusted 2017 land area and crop output estimates as base figures. This was applied in conjunction with reports from ADPs, inputs from crop models such as SARRA-H, commodity and strategic development initiative reports. A summary of the findings of the 2018 survey is presented below:

Rainfall Situation

- The total amount of rainfall experienced in 2018 was substantially higher than 2017. September was the peak month that rainfall was experienced in 2018. The cumulative annual rainfall analysis as reported by NIMET showed that a vast portion of the country recorded between 1,400-2,400mm of rain. The number of rain days ranged between 46 and 199 days in 2018. Most parts of the nation recorded normal to above normal rainfall (based on the 30 years average).
- Heavy rains that resulted into floods were experienced in 2018 similar to the 2012 occurrence. More than 20 states reported floods cases with varied level of severity that affected crops, livestock and farmhouses. NIMET reports high one-day rainfall values in excess of 100mm to have been observed over many cities across the country. Some of the agricultural commodities affected were rice, maize, millet, sorghum, vegetables, cassava, cowpea, yam, sugarcane, poultry and aquaculture. There were also occurrences of dry spell between June and July in some parts of the country.

Use of Improved Farm Inputs

- Farm inputs (seed and seedlings) were reported to have been procured and distributed by less than half the states nationwide. Generally, the quantities procured and distributed were inadequate and expensive.

- The quantities and cost of planting materials, at majority of the states were inadequate, very expensive and out of reach of the common farmer.

Use of Agro-Chemicals and Farm Equipment

- Very limited quantities of agro-chemicals and limited volume of farm equipment were procured and distributed by states. Low use of agro-chemicals by farmers was reported to be due to their high cost.
- Farmers were unable to access such improved equipment due to their non-availability and high cost.

Use of Livestock and Fisheries Inputs

- Most livestock and fisheries inputs such as feeds, drugs and vaccines were generally available and obtained through the open market.

Crop Pest, Diseases and Natural Hazards

- Wet season agricultural production in Nigeria is always faced with problems of pests, diseases and sometimes natural hazards as a result of the farmer's inability to mitigate the vagaries of weather and climate that favour disaster and spread of diseases. The main disaster experienced by farmers were floods across almost all the States in the country with more severe impact in States that are along the Niger, Benue and Gongola rivers and their tributaries. These floods destroyed farm lands, drowned humans and farm animals.
- Generally, crops pests and diseases are mainly those that are recurrent over the years within the country.
- The effect of dry spell especially, that which occurred at the beginning of the planting season in Northern parts of the country was exacerbated by army worm infestation. Other pests and diseases infestation that occurred during the wet season of 2018 differed with crop species and location. Also, there were differences in the severity of damages caused and the management practices employed.

Agricultural Mechanization

- Generally, tractor availability from Government sources reflected a decline in the numbers of functional tractors and an increase in the numbers of non-functional tractors.
- The tractor availability by the private sector is becoming more pronounced. The Tractor Owners and Hiring Facilities Association of Nigeria (TOHFAN) is currently driving the private sector tractor hiring services in Nigeria. The association is collaborating with international tractor manufacturers like John Deere, Mahindra, Tata, New Holland among others.

Cost of Production of Major Crops Per Hectare

- The general outlook of production costs per hectare of major crops across the nation showed slight to significant increases over 2017.

Grain Reserves

- Grains storage were generally reported to be through traditional and modern storage structures which are rumbus, barns and silos.

Food Commodity Prices

- Comparison of prices were made between January and July 2017 and the corresponding periods in 2018. As in previous years, general increases in prices of most commodities were recorded across the country due to the general rise in prices in the economy.

Land Area and Crop Production Estimate for 2018

- Rice, maize, sorghum, millets, Yam and Cassava remained the major staple foods in the country. Land Area and Crop Production Estimates increased 2018.

Livestock Production, Pests and Diseases in Nigeria

- Livestock populations were generally estimated to increase in 2018.
- Contagious Bovine Pleuropneumonia (CBPP) was reported in six (6) Northern States. Foot and mouth disease was also reported among cattle populations in 10 States.

Fisheries Production, Pests and Disease Situation

- Data on fisheries production for the year 2018 were generally not available across the states, with only four (4) states providing information both on aquaculture and captured fisheries respectively. Increase in aquaculture production were reported in 2018 compared to 2017. Generally, diseases such as broken skulls, swollen belly, fin rot, white patches on the skin and barbels, and bruised mouth were reported.

ADP Funding Situation

- State Governments have been the major source of fund for the ADPs. Most States appropriated less than 20% capital budget. Generally, there was decline in funding compared to previous years.

Performance Indicators of ADPs

- Farm families numbers ranged from 1,620,000 in Kano state to 95,465 farm families in Bayelsa
- There was generally a decrease in the number of VEAs from 2017 to 2018 across the nation's ADPs. The federal Government intervention through the N-Power (Agro) has however assisted in boosting the number of frontline extension agents across the country. Generally, VEA's visit to farmers declined from 2017 to 2018.

Technology Dissemination Strategies (OFAR, MTP)

- Very poor linkages between extension and research as most states were observed could not hold MTRM and FNT. Twenty-four states reported a total number of 5648 extension agents.

Challenges of ADPs in Nigeria

- Major challenges hindering efficient performance of the ADPs include poor funding, low staffing, and inadequate transportation/utility vehicle affecting virtually all states. Others include inadequate extension material, high EA:farmer ratio, insufficient allowances, inadequate training, poor media services.

General Constraints to Agricultural Production

The general constraints or challenges to agricultural production in 2018 include the following:

- Weather-related Challenges to Agricultural activities: Severe flooding was experienced in 27 states, across all the zones of the country. Sixteen (16) states recorded prolonged dry spells, with the highest prevalence in the northwest and northeast.
- Farm Inputs availability and accessibility: State Government-facilitated distribution of inputs were largely unavailable in many states for the year 2018. Limited quantities of agrochemicals and planting materials were provided by some states.
- Production-related Challenges (land, labour and diseases): The greatest challenge to agricultural production reported by farmers in 2018 was high cost of labour (both manual and mechanical). Generally, there was widespread infestation of army worms and stem borers on maize, beetle attack on yam as well as foot and mouth disease on cattle.
- Agricultural Mechanization: Majority of farmers were unable to access tractor services due to high cost of hiring services.

- Extension Support Activities: Some critical challenges encountered by ADPs were inadequate capacity building for their staff, inadequate staffing and non-payment of counterpart fund. Over 50% of the ADPs had zero fund release for the year 2018. There was also the challenge of encroachment into and duplication of ADP's activities in the states through creation of parallel agencies.
- Agricultural Broadcast: All 37 ADPs were not able to air agricultural programmes due to high cost of airtime and the lack of equipment. Farmers have challenges with both accessing the signals and the time of broadcast.
- E-Extension: Most ADP staff are highly constrained in the use of e-extension channels. The major constraints faced by ADPs' are: high cost of data (86.5%), lack of support infrastructures (81.1%) and poor network connectivity (72.9%).
- Security-related Challenges: Agricultural activities were heavily compromised by the persistent crisis between herdsmen and farmers, as well as cattle rustling. Furthermore, farmers reported communal clashes, insurgency/militancy and kidnapping were constraining factors to agricultural activities in the year.

1.0 INTRODUCTION

The 2018 wet season agricultural performance survey was conducted between Sept. 2nd-9th 2018. The survey is a major annual activity of the National Agricultural Extension and Research Liaison Services (NAERLS) and involved field problems identification, generation of agricultural production, processing and marketing data etc.

The objectives of the survey were to:

- Evaluate the performance of crops and livestock during the season and estimate outputs;
- Generate production forecasts for major agricultural activities during the 2018 Wet Season.
- Identify the constraints to increased agricultural productivity;
- Identify conditions affecting effective technology transfer and advisory services within the season; and
- Provide feedback on field situation and farmers' problems for improved research and policy performance.

The survey was carried out by the NAERLS in collaboration with the following organizations: 36 State and FCT Agricultural Development Programmes (ADPs); States Ministries of Agriculture in 36 states and FCT; Federal Department of Agricultural Extension (FDAE), FMARD; National Bureau of Statistics (NBS); Nigeria Meteorological Agency (NIMET); Planning and Policy Coordination Department (PPCD), FMARD; Federal Department of Fisheries and Aquaculture (FDFA), FMARD; Federal Department of Agriculture (FDA), FMARD; Federal Department of Animal Production and Husbandry Services (FDAHS), FMARD; Department of Monitoring and Evaluation, Federal Ministry of Budget and National Planning FMBNP; Deutsche Gesellschaft Fur Internationale Zusammenarbeit (GIZ) GmbH- Nigeria; World Food Programme, (WFP) Abuja; Institute for Agricultural Research (IAR), ABU, Zaria; Institute of Agricultural Research and Training (IAR&T), OAU, Ibadan; National Animal Production Research Institute (NAPRI), ABU, Zaria; Nigerian Institute for Horticultural Research (NIHORT), Ibadan; Nigerian Institute for Oil Palm Research (NIFOR), Benin-City; and Nigerian Hydrological Services Agency (NIHSA), Abuja.

In the continual effort of the NAERLS to qualitatively strengthen output of the survey, scientists' capacity to elicit quality information were strengthened. An open software was used to retrieve and manage electronic data. This also included a continuous process of identifying strategic partners for the development of synergy in data collection. The NAERLS will work with partners to strengthen the integration and utilization of Remote Sensing and GIS Techniques in it's sampling methodology.

2.0 METHODOLOGY

A participatory approach to the survey combining qualitative and quantitative techniques were employed in data generation. These included consultations and dialogues with stakeholders, questionnaire survey, Participatory Rural Appraisal (PRA) and interviews. Nineteen (19) multidisciplinary teams of three scientists each, making a total of 56 scientists, carried out the exercise across the 36 states and the Federal Capital Territory (FCT). In every state, two ADP zones were selected for visit. In each zone, two LGAs were selected and one community selected per LGA. Five farmers were randomly selected from each community using systematic random sampling for interview and focus group discussions. The APS sample size was designed to be representative at the state agroecological levels and covered only small-scale farmers. Data collection was done using computer assisted personal interviewing devices (CAPI). The activities of the teams were monitored at two levels within each zone by the APS Coordinator and six supervisors who monitored team movement and activities. Extensive discussions were held with the ADPs staff, ministries' officials and staffs of other relevant agencies. Final wrap-up sessions to validate the data generated and findings were held at the end of each state visit with officials of the State ADP and Ministry of Agriculture.

A special team further visited six selected states (Jigawa, Kebbi, Adamawa, Kogi, Niger and Delta) to assess the impact of floods on food production due to widespread incidence of floods after the fieldwork. Checklist was used for the collection of information from agencies in the state including Agricultural Development Projects (ADP), State Emergency Management Agency (SEMA), National Emergency Management Agency (NEMA), State Ministry of Agriculture, Nigerian Meteorological Agency (NiMet), Nigerian Hydrological Services Agency (NIHSA). Field visits and group discussions were held at affected communities.

Data collected were analyzed using the Statistical Package for the Social Sciences (SPSS v23). Appropriate statistical procedures for description (frequencies, percent and means) were used. Each indicator was computed and summarized using validated methods. Appropriate statistical procedures for description were used. Relevant indicators were computed and summarized using validated methods. Forecasts of 2018 crop yields involved the use of adjusted 2017 land area and crop output estimates as base figures. This was applied in conjunction with reports from ADPS, inputs from crop models such as SARRA-H, commodity and strategic development initiative reports. The findings of the survey are presented below.

3.0 WEATHER SITUATION

3.1 Rainfall Situation

The amount of rainfall, rainy days and maximum temperature across the six geopolitical zones of the country are as presented in Figures 3.1-3.12 and Tables 3.1 – 3.12.

The total amount of rainfall experienced in 2018 was substantially higher than 2017. September was the peak month that rainfall was experienced in 2018. The cumulative annual rainfall analysis as reported by NIMET showed that rainfall amount of 500- 1250mm was recorded in the entire northwest and northeast axis of the country. Most parts of the nation recorded normal to above normal rainfall (based on the 30 years average). Also, within this range are Bida, Benin, Awka, Asaba, Minna, Abuja and Shaki in the central and southwest axis respectively. Most parts of the south-south recorded the highest rainfall amount of between 2,400 and above 3000mm in Benin, Awka, Asaba, Warri, Owerri, Ikom, Port-Harcourt and Uyo. NIMET analysis shows that above normal number of rain days were recorded in August 2018 for most parts of the country. The number of rain days ranged between 46 in Nguru and 199 days in Warri for the year 2018. NIMET reports high one-day rainfall values in excess of 100mm to have been observed over many cities across the country.

Heavy rains that resulted into floods were experienced in 2018 similar to the 2012 occurrence. More than 20 states reported floods cases with varied level of severity that affected crops, livestock and farmhouses. Some of the agricultural commodities affected were rice, maize, millet, sorghum, vegetables, cassava, cowpea, yam, sugarcane, poultry and aquaculture. There were also occurrences of dry spell between June and July in some parts of the country. NIMET reports indicate that dry spell episodes (rainfall 0 to 0.3mm for at least 7 consecutive days) was experienced in some states. The dry spell episodes occurred at the critical period before flowering of most crops. Borno, Jigawa, Sokoto, Yobe and Zamfara states had double episodes in the month of June and July lasting 8 to 13 days. The dry spell episodes in Yobe state was longer, lasting 13 days in Nguru between June and July. The dry spell episode recorded in Kwara state lasted 16 days. NIMET further reports the dry spell episode in Katsina, Bauchi and Kano to be mild when compared to previous years. The effect of the dry spell in the affected states resulted in replanting, thereby adding to the cost of production for farmers.

Heavy rain that resulted into flood occurred in 2018 which was similar to what occurred in 2012. More than 20 states reported flood cases though the level of severity were not the same. It ranged from light to very severe which affected crops, livestock, farmhouses and whole settlements. Some of the agricultural products affected were rice, maize, millet, sorghum, vegetables, cassava, cowpea, yam, sugarcane, poultry and aquaculture. The states that were seriously affected are those along the shores of Niger and Benue rivers. Some of the affected states were Kogi, Niger, Kwara, Benue, Taraba, Adamawa, Jigawa, Kano, Katsina, Gombe, Kebbi, Anambra, Delta, Edo, Bayelsa etc. Data indicated that despite heavy rainfall that was experienced in 2018, there was still mild dry spell occurrences in

some parts of Nigeria which occurred between June and July. Some of the states affected were Zamfara, Kebbi, Yobe, Adamawa, Oyo, Taraba, Plateau, Gombe, Kogi, Ogun, Edo, Osun, Benue, Ekiti, Kwara, Akwa Ibom, Bauchi, Imo, Nasarawa and Kwara. Some of these affected states have earlier been predicted by NIMET to witness dry spell and flood occurrence.

North-East Zone

Total amount of rainfall in all the States in the zone in 2018 was more than 2017 with the exception of Maiduguri in Borno State where 2017 total rainfall was higher than 2018. First rainfall was experienced in the month of February in Borno and Yobe States and fully established by May in all the states in the zone in 2018. Bauchi experienced the highest amount of rainfall (1505.9mm) in the zone while Yobe had the least (518.5mm). Gombe, Adamawa and Yobe states witnessed dry spell in the month of June – July while there was flood occurrence in Adamawa and Gombe States. Maiduguri in Borno State recorded the highest (57) rainy days in 2018 while Yobe and Adamawa had the least (41).

North-West Zone

Rainfall started in April 2018 in most of States (Kaduna, Katsina, Kebbi and Sokoto) in the zone. Rain was fully established across the states in May with the highest (1527.1mm) in Kaduna and the least (683.8mm) in Sokoto. Zamfara and Kebbi States experienced dry spells and there was record of flood occurrence in Kebbi, Jigawa, Kano and Katsina states in the zone. Kaduna State had the highest (67) annual number of rainy days while the least (35) was recorded in Sokoto State in 2018.

North-Central Zone

Total amount of rainfall experienced in all the States in the zone in 2018 was more than what was experienced in 2017 except in FCT. In 2018, Kwara State had the highest (4772.5mm) amount of rainfall while FCT had the least (937.2mm). Rainfall was fully established in April 2018 in most states in the zone. However, it commenced in February in Benue, Plateau, Kogi and Niger though it was intermittent. Dry spell was experienced in the months of June that affected Kwara, Nasarawa, Taraba, Plateau and Kogi States. The zone also witnessed flood occurrence that affected Kogi, Niger, Kwara, Benue and Taraba States. Plateau State had the highest (82) annual rainy days while Taraba had the least (50) in 2018.

South-West Zone

Rainfall commenced early in January 2018 in most states of the zone. Nevertheless, it started in February in Ondo and Osun States. There was incidence of flooding occurrence in Lagos and Oyo States. Likewise, dry spell was experienced in Oyo, Osun, Ekiti and Ogun States. Cumulative data indicated that Ogun State had the highest (83) number of rainy days while Oyo had the least (52) in 2018. Ijebu Ode in Ogun State recorded the highest (1791.3mm) total amount of rainfall in the zone in 2018 while Shaki in Oyo State recorded the least (886.3mm)

South-East Zone

Abia State had the highest (3344.6mm) total amount of rainfall while Anambra State recorded the least (1646.7mm). Rains started in February in most parts of the zone except Enugu state that witnessed first rainfall in March. Incidences of severe flooding were reported in Anambra state in June and July. Imo, Anambra and Abia States experienced dry spell in 2018. The highest (95) annual rainy days was recorded in Anambra while the least (63) was recorded in Abia State in 2018.

South-South Zone

Unlike 2017 when rainfall started across the zone in January, rain commenced in the zone in 2018 by February with intermittent dry spells until April when the rains were fully established. Incidence of flood occurrence was reported in Delta, Edo and Bayelsa states while dry spell was recorded in Akwa-

Ibom and Edo States. Cumulatively, Akwa-Ibom State had the highest (134) number of rainy days while the least (66) was recorded in Cross Rivers in 2018.

3.2 Total Monthly Maximum Temperature (°C)

Mean values of maximum temperature ranged between 30.0 – 34°C across the country ranged from 28- 37°C in 2018. The pattern of occurrence was that in Northern part of the country, highest mean temperature occurred around April and lowest by January. In Southern part of the country, highest mean temperature was recorded around February and lowest in August.

North-East Zone

Maiduguri recorded annual mean maximum temperature of 36.1°C while Bauchi recorded least (33.2°C) in the zone in 2018. Mean maximum temperature recorded across the stations in the zone was almost the same for both years. However, the lowest monthly mean temperature of 31.1°C was recorded in August for 2017 and 30.5°C in January for 2018. The highest monthly mean temperature of 39.9°C and 40.2°C were both recorded in April for 2017 and 2018 respectively.

North-West Zone

Sokoto State recorded highest mean maximum temperature of 36.0°C and 35.3°C in 2017 and 2018 respectively whereas the lowest was recorded in 2017 (32.5°C) and 2018 (31.9°C) both in Kaduna. The mean maximum temperature in the North West was similar to that of the North-East. The lowest monthly temperature of 30.1°C was recorded in August and 29.7°C in January for 2017 and 2018 respectively whereas highest temperature of 40.2°C and 40.0°C both in April were recorded.

North-Central Zone

The lowest mean temperature was recorded in Jos as 27.9°C and 27.6°C for 2017 and 2018 respectively. The highest temperature was recorded in Bida, Niger State for 2017 (34.7°C) and 2018 (34.0°C). In addition, the lowest monthly temperature of 28.9°C recorded in August and 29.8°C in July for 2017 and 2018 respectively whereas highest temperature of 38.4°C in March and 37.5°C in April were recorded.

South-West Zone

The month of August recorded the lowest monthly temperature of 27.9°C and 28.7°C for 2017 and 2018 respectively whereas month of February was recorded for the highest temperature of 35.7°C and 34.8°C for 2017 and 2018 respectively. Abeokuta in Ogun state recorded the highest temperature of 34.2°C and 33.6°C for 2017 and 2018 respectively while Ado-Ekiti recorded lowest for 2017 (31.8°C) and 2018 (31.5°C).

South-East Zone

Temperature for the zone was similar to that of South West. The month of August recorded the lowest monthly temperature of 29.1°C and 29.6°C for 2017 and 2018 respectively while month of February was recorded for the highest temperature of 36.5°C and 35.6°C for 2017 and 2018 respectively. Ebonyi state recorded the highest temperature in both 2017 and 2018 as 34.2°C and 33.5°C respectively.

South-South Zone

South South temperature was like that of South West and South East pattern where August recorded the lowest monthly temperature of 28.6°C and 29.4°C for 2017 and 2018 respectively while month of February was recorded for the highest temperature of 35.4°C and 34.2°C for 2017 and 2018 respectively. Delta State had the highest temperature of 34.0°C and 33.2°C for 2017 and 2018 respectively whereas Eket in Akwa-Ibom recorded the least for both 2017 (28.7°C) and 2018 (28.5°C).

4.0 USE OF IMPROVED FARM INPUT

4.1 Planting Materials

Farm inputs (seed and seedlings) procured and delivered by states in 2018 is presented in Tables 4.1-4.5. From the table, only 10 states and the FCT supplied data on various planting materials procured and distributed. Agricultural Development Projects, some agricultural research institutes, state input supply companies were involved in the procurement and distribution of improved seeds. Other sources of some of these inputs were Private Seed Companies; Out growers, NGOs and farmer organizations. While some few states reported that farmers were comfortable with the quantities and cost of planting materials, majority of the states, however reported that the quantities procured and distributed were not adequate, very expensive and out of reach of the common farmer.

Reports from the north western zone of the country indicated that Jigawa was the only state that supplied adequate improved rice, and millet seeds to farmers at affordable prices during 2018 wet season. Sesame was however procured and distributed but the quantity was not adequate to the sesame farmers. For north central zone states, seeds and seedlings procured and distributed were improved maize and rice seeds in FCT, Kwara, Nasarawa and Benue, although the quantity was only adequate and affordable to farmers in Nasarawa state. Cashew Seedlings and cassava stems were also procured and distributed to farmers in Kwara and Benue states respectively but not in adequate quantities. Except Lagos state which supplied improved maize seed, cassava stems and oil palm seedling to farmer, although at high price, all states of the south-western zone of the country were not able to supply farmers with seeds and seedlings during the 2018 wet season. Planting materials for root and tuber crops such as cassava, oilpalm, citrus coconut, local pear, plantain, and pineapple were available in the South-East and some South-South states; some of which were at affordable process. Improved Maize seed was also available in Abia and Akwa Ibom states.

Generally, seeds of cereal crops were the most widely distributed while few states distributed fruit seedlings across the zones. Planting materials for root and tuber crops were available in the South-West, South-East and some North Central states. Discussion with farmers indicated that although there was increased awareness on the use of improved seeds/planting materials by farmers many of them were unable to access such improved inputs due to their non-availability and high cost.

Table 4.1: Use of Farm Inputs (Seed and Seedlings) Procured and Delivered by States in 2018 in the Northwest Zone

4.2 Agro-chemicals and some Farm Equipment

The purchase and distribution of agro-chemicals are presented in Tables 4.6- 4.10. Only 6 out of 36 states and the FCT procured and distributed agro-chemicals and some farm equipment mostly through Agricultural Development Projects and input supply companies. Other major sources were Federal Government agencies and private agro-chemical companies. Other farm equipment supplied to farmers includes sprayers, water pumps, storage bins, knitting machines, agro-processing equipment etc. Data show that there were very limited quantities of agro-chemicals at affordable prices. Discussions with farmers revealed that low use of agro-chemicals was due to their high cost.

4.3 Livestock and Fisheries Inputs

Information on purchase, and use of livestock, fisheries and poultry inputs are presented in Tables 4.11-4.14. Only 6 states and the FCT reported purchase and use of livestock and fisheries inputs by farmers. Most of the inputs are feeds, drugs and vaccines, obtained through open market. Other major sources were Federal Government agencies and private livestock drug and feeds companies. Other inputs used by farmers were fish fingerlings. Data show that there were adequate supplies of the inputs in North Central and South Eastern zones of the country. However, very limited quantities of the inputs were procured in the south-South and south east zones of the country and the prices not affordable. Discussions with farmers revealed that low use of the inputs was due to unavailability and high cost.

4.4 Farm Equipment

Use of farm equipment during the 2018 wet season was reported by 18 states from the 6 geopolitical zones of the country as presented in Tables 4.15-4.20. Agricultural Development Projects, some agricultural research institutes, state input supply companies were involved in the procurement and distribution of equipment. While some few states reported that farmers were comfortable with the quantities and cost of planting materials, majority of the states, however reported that the quantities procured and distributed were not adequate, very expensive and out of reach of the common farmer.

Generally, the farm equipment were tractors, working bulls, agro-processing equipment, storage bins and water pump. Discussion with farmers indicated that although there was increased awareness on the use of improved farm equipment by farmers many of them were unable to access such improved equipment due to their non-availability and high cost.

5.0. CROP PESTS, DISEASES AND NATURAL HAZARDS

Wet season agricultural production in Nigeria is always faced with problems of pests, diseases and sometimes natural hazards as a result of the farmer's inability to control the vagaries of weather and climate that favour disaster and spread of diseases. During the 2018 Agricultural performance Survey (APS), notable disaster experienced by farmers were floods across almost all the states in the country with more severe impact in states that are along the Niger, Benue and Gongola Rivers and their tributaries that add to the volume of water into them from rainfall and other water bodies. These floods destroyed farm lands, drawn farm animals and killed including humans. Notable examples are the floods in Gombe and Adamawa States in North East, Niger and Kogi in North central, Cross Rivers and Bayelsa in South-south, Kebbi and Jigawa, in North West states of the country.

There were also reports of scorching of plants due to the effect of irregular rainfall and dry spells after the rains began, especially in some northern parts of the country. In some parts of Southern parts rainfall started late, between May and June as against February and March of the previous years. This led to delayed planting with the attendant expectation of delayed harvest period. Supply of seed of early maturing crop commodities known to have drought tolerant varieties helped farmers to cope with the weather problem. After the rainfall established in the North west, North East, North Central, and some other parts, the rains became so torrential and intense that erosion, flood and water logging conditions in cropped lands were experienced late in August, when millet and maize were getting mature for harvest. It was so severe in places such as, Purokayo and Lakumna in Guyuk Local Government in Adamawa State, that some farmers even reported loss of farm produce to the tune of 70-100%. Consequent to water logging, some affected farms where no yield was anticipated had to be abandoned. In South-South, due to erosion, flood or water logging, in some local Governments in Cross Rivers State, any farm produce whether matured or not, was harvested to minimize losses. The most affected crops were the tuberous crops, cassava, potatoes and yams that rot in the presence of excess water. In some parts of South West and South-East, establishment of the rains was remarkable for its very high intensity and the attendant negative effects of flood, erosion, and water logging on farm lands and farms between August and September. Again these resulted in losses and untimely harvests of affected crops. A special report on the status and effects is given in a separate chapter.

Generally, crops pests and diseases were mainly those that have been recurrent over the years within the country (Tables 5.1). Incidences of pest infestation that were experienced in most field crops during the 2018 wet season included army worms with incidence and heavy severity on maize, millet and rice were reported in parts of Delta, Akwa Ibom, FCT, Nasarawa, Kwara, Jigawa, Enugu, Bauchi, Ekiti, Ebonyi and Gombe States. They caused an estimated 10% yield loss in the infested crops. The scorching effect of dry spell especially, that which occurred at the beginning of the planting season in northern parts of the country was exacerbated by this pests (army worms). Pestiferous activity during the wet season 2018 was wide spread across the nation from the South, in Akwa Ibom, Ogun, Edo, and Rivers through the Central FCT to the Northern extremities of Borno and Gombe. The severity was moderate and the damage to the crops which is greater than 5% makes it a problem that should be given serious attention. Grasshopper, non-discriminatory and pestiferous to most field crops also, occurred in parts of Imo and it reported to be moderate in its severity. From Rivers, Akwa Ibom, Nasarawa, Imo Oyo and Kaduna States, stem borers were reported to be generally pestiferous to the staple crops, maize, millet, rice, and benniseed. Though the severity of infestation is reported as light, the consideration of an estimated yield loss of more than 10% of the total production of each affected crop in the state implies some heavy toll on the produce.

There were reports of increased infestation of fall armyworm (FAW) across Nigeria in an FAO study undertaken by IAR & T. FAW severity level was generally reported to be between moderate and high in the northern and southern states (Fig 5.1 and 5.2)

Table 5.1: Incidences of Pests, Diseases and Natural Disasters on Crops in Nigeria					
Affected Crop	Pests/ Diseases/Hazard	Affected States	Severity*	Yield loss Estimate (%)	Management Practice(s)

Fig. 5.1: Distribution of farmers based on first experience of Fall armyworm infestation in the South and Kwara (source: IAR&T, 2019)

Fig. 5.2: Distribution of farmers based on first experience of Fall armyworm infestation in the North (source: IAR&T, 2019)

Other pests' and disease infections that occurred during the wet season of 2018 differed with crop species and location. Also there were differences in the severity of damages caused and the management practices employed. Generally, for low or high pests and disease infections, cultural and mechanical options were used, to manage the situation. Chemical pesticides were commonly adopted by farmers.

6.0 AGRICULTURAL MECHANIZATION

Agricultural mechanization is the use of equipment and machineries for agricultural productivity. The machines are expected to reduce drudgery and increase productivity. Increasing productivity through agricultural mechanization includes use of processing equipment/machines that add values to agricultural produce. Agricultural mechanization generally include not limited to use of tractors, power tillers, animal traction, and processing equipment.

Agricultural Performance Survey (APS) of 2018 captured tractor usage at both government and private sector levels, animal traction and processing equipment/mills availability all over the country.

6.1 Government Tractor Availability

The study showed that very limited number of tractors were available to the farmer by government. The facts about this assertion is presented in the tables below.

Bauchi and Yobe state in the North East of Nigeria reported the availability of some Government tractors as presented in Table 6.1. The number of functional tractors available within the zone was seen to decrease when compared with 2017 while the number of non-functional tractors increased. The decreases resulted in a negative percentage change for most of the tractors. Due to the decrease in the number of functional tractors, the hectares of land cultivated was found to decrease as well.

In the North west zone (Table 6.2), only Kebbi state reported Government tractor availability. There was no functional tractor reported in both 2017 and 2018.

Government tractor availability in the North central zone was only reported by Plateau and Nassarawa as shown in Table 6.3. The Government tractor availability in the north central decreased within the years under review and the non-functional tractors increases. The peculiarity with this zone was that despite the reduction in the number of functional tractors available, the hectares cultivated by these tractors increases. An increase from 2.5Ha cultivated in 2017 and 3Ha cultivated in 2018 amounting to a percentage change of 20% area cultivated in Plateau state. Also in Nassarawa state, an increase from 10 – 21.3Ha was reported, 113% change. These increases in Hectares cultivated could be associated to the several number of tractors available, especially in Nassarawa and the excessive use of these tractors which could amount to total brake down in subsequent years. Plates 6.1-6.4 show some of the equipment in the field during the survey.

Plate 6.1: Some of the newly bought tractors in Jigawa State

	MF	N/A	N/A	N/A	11	11	0	N/A	N/A	N/A
	New Holland	N/A	N/A	N/A	3	3	0	N/A	N/A	N/A
Average		98.67	91.33	-23.87	6.88	10.75	44.31	4.17	8.1	44.33

From Figure 6.1, it is clearly indicated that Nassarawa state has the highest number of hectares cultivated and Non-functional tractors in 2017 and 2018. While plateau state has the highest number of functional tractor in the zone. The average number of functional Government tractors in the zone was 98.67 in 2017 and 91.33 in 2018, while the average hectares cultivated by these tractors were reported to be 4.17ha in 2017 and 8.1ha in 2018.

Delta state in the south south zone reported Government tractor availability (Table 6.4). There was a decrease of 50% change in the functional tractors and an increase of 75% change in the number of non-functional tractors. Hectares cultivated was also found to decrease by 12.04%.

Lagos, Oyo, Ekiti and Osun state reported availability of Government tractors in the south west zone (Table 6.5). Lagos state has Fiat, SWARAJ, John Deere and Mersey Fergusson brand of tractors. The Fiat and SWARAJ was functional in 2017 and 2018 and cultivated 300 and 242 Ha respectively in 2018. This amounts to a percentage change of 39.54 and 272.31 respectively. Conversely, the John Deere and MF tractors was 4 in 2017 and 3 in 2018 for functional ones while non-functional increased from 16 to 17 in 2017 and 2018 respectively. The area cultivated by the John Deere and MF tractors was also reported to have 19% decrease. This decrease in hectare is associated with the decrease in the number of functional tractors in the state.

However, Ekiti and Osun state reported quite some number of non-functional tractors. Though, Osun state has 8 functional tractors in 2017 and 2018, while the non-functional ones was 12 for 2017 and 2018. Ekiti has 16 different brands of tractors which were all reported to be non-functional.

The states that reported Government tractor availability in the south east zone as shown in Table 6.6 were Ebonyi, Imo, and Abia. Imo state has 1 functional tractor in 2017 and 2018 which cultivated about 15 and 20 hectares in 2017 and 2018 respectively. Abia state has 4 John Deere tractors and 2 power tillers. The tractor cultivated 450 and 652 hectares in 2017 and 2018 respectively, a percentage increase of 44.9%.

Generally, the outlook of Government tractor availability nationally reflected a decline in the numbers of functional tractors and an increase in the numbers of non-functional tractors. Also, there were instances where the hectares cultivated by these limited tractors were reported to increase. This is as a result of overburden use of these tractors which leads to break down over time. The increase in the numbers of non-functional tractors could be associated to the influx of unorthodox tractors (Licher, Ursus, Bellarus, SWARAJ, Ficher, QLN) into the country, lack of expertise and capability to maintain and operate these tractors. Most states no longer operate tractors for farmers' use, rather tractors are purchased and sold at competitive market price to interested farmers'.

6.2 Private Sector Tractor Usage

The tractor availability in the private sector appears to be better than the ones obtained in the public sector. The Tractor Owners and Hiring Facilities Association of Nigeria (TOHFAN) is a major stakeholder currently driving the tractor hiring services in Nigeria. The association covers almost all states of Nigeria, though, prominent in the north west of Nigeria. The association collaborates with international organizations like John Deere, Mahindra, Tata, New Holland among others. The collaboration is tailored at expanding the availability of tractors to all farmers' in Nigeria. The 2018 Annual Agricultural Performance Survey (APS) received data of available private tractors in Nigeria. The states that has available data are Kaduna, Kano, Katsina, Niger, FCT Abuja, Sokoto, Oyo, Kwara, Zamfara and Adamawa as presented in table 6.2a. The type of tractors available in these states are Mahindra, John Deere, Massey Fergusson and Case with capacities ranging from 50hp – 75hp.

Table 6.7 showed that private tractor availability is more in Kaduna, FCT, Niger and Kano. Kaduna state has about 162 private tractors operating there in 2017 and increased in 2018 to 439. FCT, Niger and Kano state has 40, 30 and 10 tractors. The number of non-functional tractors as reported by private operators is very insignificant across the states (Figure 6.2). The total number of functional private tractors within the states that reported them was found to be 275 in 2017 and 552 in 2018 while the number of non-functional tractors was 13 for both 2017 and 2018. This is an indication that the private tractor endeavor to maintain their tractors in order to reduce the number of non-functional tractors.

The number of hectares cultivated both in 2017 and 2018 was 68040 and 184420 in Kaduna state. The total number of hectares cultivated by private tractors within the mentioned states in 2017 and 2018 was 115500 and 231880 respectively. A remarkable percentage change of 100.8%.

More so, equipment like plough, harrow, ridgers, tipping trailers, boom sprayers, planter, seed drill, threshers and shellers for maize, millet, rice, wheat, sorghum and cowpea was procured. The number of these equipment was reported to increase in number procured in 2018 than in 2017.

Table 6.7: Private Sector Tractor availability in 2017 and 2018 TOHFAN

State	Type of Tractor & Capacity (HP)	Functional		Non Functional		Hectares cultivated

6.3 Animal Traction (Work Bulls) Availability

Animal traction is an aspect of agricultural mechanization that involves the use of cattle for agricultural production and this is prominent in the northern part of Nigeria. Table 6.9 presents the number of workbulls in some states across the country.

Animal traction usages were reported in Zamfara, Taraba, Plateau, Bauchi and Kaduna states. In Zamfara and Kaduna states percentage decrease in usage were 15.63% and 91% respectively for 2018 when compared with 2017. The decrease was reported to be associated with insecurity situation and cattle rustling in the 2 states. However, Taraba, Plateau and Bauchi reported an increase in animal traction usage with percentage increase of 30%, 22.5% and 100% in the 3 states respectively between 2017 and 2018..

The use of animal traction has its associated shortcomings, few among them are high cost of bull feeds, occurrence of pests/diseases, inadequate veterinary clinic/staff, cattle rustling, and inadequate grazing land.

Table 6.9: Number of Work Bulls Available

No. of Work Bulls				
	2017	2018	% Change	Remarks
Zamfara	32000	27000	-15.63	Cattle rustling, high cost of feeds, incidences of diseases/pest, inadequate veterinary clinics/staff.
Taraba	200	260	30	Lack of proper training, Lack of funds to maintain the oxen.
Plateau	80	98	22.5	Distortion of peace in the state
Bauchi	600000	1200000	100	Poor capital for farm investment, More of efficient and improved farm tools required, Further training required on farming techniques (modern)
Kaduna	5000	450	-91	Cattle rustling, Lack of grazing land.
Average	127456	245561.6	9.174	

6.4 Processing Plants

Crop processing is another aspect of agricultural mechanization which ensures value addition to agricultural produce in order to extend the shelf-life, improve quality and maximize profit. Primary processing of crops include threshing, shelling and winnowing, while the conversion of crops from their original form to another like cassava flour, maize flour, gari, tomato paste are secondary processing. Plates 6.5-.6.7 are traditional and modern processing mills in some parts of Nigeria. Various forms of equipment, machines and machineries used for processing crops were reported across the nation.

Plate 6.5: Small Scale Processing mill

Plate 6.6: Traditional rice processing plant

Plate 6.7: Modern rice processing plants

Processing plants available in the North East as presented in Table 6.10 are Bauchi, Gombe, Taraba, Yobe and Borno states. Crops processed are rice, cassava, maize, acha. Gombe state has rice processing mills in Dogonruwa, Taura and Bajoga, each with a capacity of 4.8 metric tons per day. Maize processing plants are available in Jessy, Biller and Tesla with operating capacity of 2.5 Mt/day. Borno state has processing mills for grains, seeds and rice with operating capacities of 20, 24 and 12 Mt/day respectively.

Table 6.10: Processing Centers in the North East Zone

In the North West, Kaduna, Jigawa, Zamfara and Kebbi state reported the availability of some processing plants. In Kaduna state, Olam Mills process grains for livestock with 50,000 metric tonnes in a day. Jigawa hosts 3 rice processing plants and a flour mills. The rice mills has a processing capacity of 75 metric tons. Quite a number of rice processing mills, cotton and ground nut are present in Zamfara state (Table 6.11).

The north central states that reported processing plants were Kwara, Plateau, Nassarawa, Benue and Taraba states as presented in Table 6.12. The plants reported by Kwara state are generally medium scale that process crops like rice, yam into flour, cassava into Garri and size reduction machines (Hammer mills). Plateau state also reported some small to medium scale plants that process crops like rice, acha, coffee, potatoes into chips and honey. Nassarawa state process mainly rice with a total operating capacity of the plants to be 40.9 metric tons in a day. Benue is another state that reported the processing of cassava into flour and garri and rice processing plants with operating capacities of 12 metric tons per day. Lastly, Taraba state in the north central zone reported processing plants that process 80 metric tons of cassava into flour, rice plants with overall operating capacities of 95 metric tons in a day and 30 metric tons of cassava is processed into garri daily.

Delta, Bayelsa, Rivers, Edo and Cross-Rivers states reported processing plants in the south south zone (Table 6.13). Processing plants in Delta state mostly process cassava into Garri while Bayelsa process cassava into garri and starch. Rivers state reported processing plants that process cassava to Fufu, Garri, High Quality Cassava Flour (HQCF), and Plantain into flour. The combine operating capacities of these plants are 20 metric tons per day. Edo state has processing plants that process crops like plantain, beans, and yam into flour. Cassava into starch, HQCF, Fufu, and Garri. Then Palm fruits into Palm oil. Each of the aforementioned plants has a processing capacity of 1 Mt/day.

South East zone, Ebonyi, Enugu, Imo, Abia and Anambra reported some processing plants for crops like rice, cassava, and palm fruits (Table 6.14). Ebonyi state has about 200 clusters of rice processing mills, each with capacity to process 1 metric ton per day, while the cassava processing plant has capacity of 3 metric tons per day. Enugu state has 2 rice processing plants with capacity of 34.4 and 32 metric tons per day. In Imo state the processing plant for palm oil has capacity for 11 metric tons per day, while the cassava processing mill has capacity of 15.5 metric tons per day. Abia state process cassava tuber to garri and HQCF, rice and palm fruits into palm oil. The operating capacities of these plants are between 2-5 metric tons in a day. Moreover, Anambra state also reported some processing plants that process cassava, rice and palm fruits with operating capacities of 8, 5 and 10 metric tons per day respectively.

Table 6.14: Processing Centers in the South East Zone

Note: Daily operation duration is estimated as 8 hours.

In the South West zone, Ekiti, Oyo and Ogun states have some processing plants (Table 6.15). Ekiti state has Cassava processing plants that process 3 metric tons of cassava into garri; rice processing plants with operating capacity of 45 Mt/day and palm fruits processing plants of 45 Mt/day for palm oil. Oyo state has capacity for processing 20 metric tons of maize and 2.5 metric tons of each of soya bean and cowpea daily. In Ogun state, some cassava processing plants have capacities for cassava flour (644 Mt/day), ethanol (250 Mt/day), garri and fufu (16 Mt/day), and starch (150 Mt/day).

Table 6.15: Processing Centers in the South West Zone

	Cassava processing	Cassava	Okitipupa	Nil
	High quality cassava flour	Cassava	Owo	Nil

Note: Daily operation duration is estimated as 8 hours.

Generally, there was an increase in crop processing activities across Nigeria. The general increase in processing plants all over Nigeria could be attributed to the awareness for enhanced productivity, the need to increase shelf-life and better market price as a result of value addition. Government policy on agriculture has also greatly contributed to the increase in processing plants.

6.5 Cost of Tillage Operations

Tillage operations are activities conducted in order to prepare the soil for better growth. Such activities include land clearing, ploughing, harrowing and ridging. The cost of these tillage operations across Nigeria is reported in this section.

The cost of land clearing farm operations in Borno state increased generally. Land clearing, ploughing, harrowing and ridging increased with percentage increases of 25%, 20%, 20%, and 50% respectively. This increase could be attributed to the curb and control of Boko Haram activities in the state. However, cost of ridging was found to decrease by 37.5% in Bauchi state while ploughing remained the same (Table 6.16).

Table 6.16: Cost of Tillage Operations in the North East Zone

North-East Agro- Ecological Zone												
State	Land Clearing (₦/Ha)			Ploughing (₦/Ha)			Harrowing (₦/Ha)			Ridging (₦/Ha)		
	2017	2018	% Change	2017	2018	% Change	2017	2018	% Change	2017	2018	% Change
Adamawa	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Bauchi	1500	2500	66.67	15000	15000	0	N/A	N/A	N/A	16000	10000	-37.5
Borno	2000	2500	25	2500	3000	20	2500	3000	20	2000	3000	50
Gombe	600	1000	66.67	5000	6000	20	N/A	N/A	N/A	5000	5000	0
Yobe	15000	15000	0	25000	25000	0	15000	15000	0	N/A	N/A	N/A
Z. Mean	4775	5250	39.585	11875	12250	10	8750	9000	10	7666.667	6000	4.166667

Figure 6.4 clearly showed that cost of ploughing operation per hectare in the zone is high. Yobe state reported N25,000 in both 2017 and 2018, closely followed by Bauchi that reported about 15000 in 2018 and 2017. The cost of tillage operation looks relatively stable in Borno state, which could be associated to the activities of Boko Haram.

Figure 6.4: Cost of Tillage Operation in the North East Zone

The cost of tillage operations in the Northwest as reported by Jigawa, Kaduna, Katsina, Kebbi, and Sokoto remains relatively the same as 2017. Zamfara state reported an increase in the cost of land clearing by 16.67%. This increase could be attributed to some virgin farm lands that was cleared for farming activities (Table 6.16).

Table 6.16: Cost of Tillage Operations in the North West Zone

North-West Agro-Ecological Zone												
State	Land Clearing (₦/Ha)			Ploughing (₦/Ha)			Harrowing (₦/Ha)			Ridging (₦/Ha)		
	2017	2018	% Change	2017	2018	% Change	2017	2018	% Change	2017	2018	% Change
Jigawa	500	500	0	15,000	15,000	0	10,000	10,000	0	10,000	10,000	0
Kaduna	500	700	40	12000	12000	0	8000	8000	0	8000	8000	0
Kano	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Katsina	700	700	0	18000	18000	0	15000	15000	0	20000	20000	0
Kebbi	1000	1000	0	20000	20000	0	15000	15000	0	15000	15000	0
Sokoto	5000	5000	0	8000	10000		6000	8000		15000	15000	0
Zamfara	3000	3500	16.67	8000	8000	0	8000	8000	0	8000	8000	0
Z. Mean	1783.333	1900	9.445	13,500	13,833	0	10,333	10,667	0	12,667	12,667	0

Cost of ploughing and ridging operation can be seen from Figure 6.5 to be relatively high. Katsina can be seen to have the highest cost of ridging per hectare 20,000 in 2017 and 2018 while Kebbi state has the highest cost of ploughing (20000) in both 2017 and 2018. Harrowing operation in the zone cost less due to use of animal traction.

Figure 6.5: Cost of Tillage Operation in the North West Zone

In the Northcentral, the cost of tillage operations in Kwara state remains the same as 2017. Nassarawa state reported an increase in land clearing and ridging from 15,000 in 2017 and 16000 in 2018 and 12,000 in 2017 and 13,000 in 2018 respectively. Also, Niger state reported an increase of 20% in land clearing and harrowing, while ploughing and ridging remains constant. Plateau state reported a decline in the cost of land clearing by 23.1% change.

Table 6.17: Cost of Tillage Operations in the North Central Zone

North-Central Agro-Ecological Zone												
	Land Clearing (₦/Ha)			Ploughing (₦/Ha)			Harrowing (₦/Ha)			Ridging (₦/Ha)		
	2017	2018	% Change	2017	2018	% Change	2017	2018	% Change	2017	2018	% Change
Kogi	N/A	120000	-	N/A	25000	-	N/A	25000	-	N/A	25000	-
Kwara	140,000	140,000	0	20,000	20,000	0	15,000	15,000	0	20,000	20,000	0

Figure 6.6 clearly showed that cost of land clearing is huge in the north central zone with Kwara and Plateau state been the highest in both 2017 and 2018. The cost of land clearing in Kwara and Plateau state were 140,000 and 65000 in 2017 and 140000 and 55000 in 2018 respectively.

Figure 6.6: Cost of Tillage Operation in the North Central Zone

The cost of tillage operations in the South west was seen to have a general increase. Ekiti, Lagos and Osun states reported a percentage increase of between 8% and 55% for all tillage operations. Only, Ondo state reported a steady increase in the cost of ploughing, harrowing and ridging, however, a 33.33% increase was reported for land clearing (Table 6.18).

Table 6.18: Cost of Tillage Operations in the South West Zone

South-West Agro-Ecological Zone												
State	Land Clearing (₦/Ha)			Ploughing (₦/Ha)			Harrowing (₦/Ha)			Ridging (₦/Ha)		
	2017	2018	% Change	2017	2018	% Change	2017	2018	% change	2017	2018	% Change
Ekiti	N/A	N/A	N/A	12000	17000	41.67	8000	12000	50	8000	12000	50

Osun	50000	60000	20	20000	25000	25	N/A	N/A	N/A	37000	40000	8.11
Z. Mean	27875	34250	25.85	13800	17800	25	11250	14750	27.089	17400	18800	9.96

Figure 6.7 showed that cost of land clearing was also high in the zone. Ogun and Osun state are the states that has the largest cost of 40000 and 50000 in 2017 and 50000 and 60000 in 2018 respectively. Ploughing operation was seen to be the next expensive cost of tillage operation in the zone. Osun and Lagos state has the highest in the zone 35000 and 23000 in 2017 and 39000 and 29000 in 2018 respectively. Conversely, the cost of tillage operation in Ondo state was reported to be low for all operations in both 2017 and 2018.

Figure 6.7: Cost of Tillage Operation in the South West Zone

The cost of tillage operation in the South east zone increased across the states. Though, Enugu state reported a stable cost for land clearing while in other states, there was a percentage change between 6% - 33.33% (Table 6.19).

Table 6.19: Cost of Tillage Operations in the South East Zone

South-East Agro Ecological Zone												
State	Land Clearing (N/Ha)			Ploughing (N/Ha)			Harrowing (N/Ha)			Ridging (N/Ha)		
	2017	2018	% Change	2017	2018	% Change	2017	2018	% Change	2017	2018	% Change

Anambra	1500	2000	33.3	1500	2000	33.3	1500	2000	33.3	1700	2500	47.1
Ebonyi	N/A	N/A	N/A	30000	40000	33.33	30000	40000	33.33	30000	40000	33.33
Enugu	3500	3500	0	N/A	N/A	N/A	N/A	N/A	N/A	3000	3500	16.67
Imo	1500	1600	6.67	1500	1700	13.33	1500	2000	33.33	1500	2000	33.33
Z. Mean	2125	2400	16.24	9000	11800	24.165	11000	14666.67	33.32	9050	12000	32.61

The cost of tillage operation in the South east zone as presented in Figure 6.8 is high, especially for ploughing, harrowing and ridging. Anambra state has the highest cost of ridging in the zone for both 2017 and 2018 to be 30000 and 40000 respectively. Ploughing and harrowing is prominently practiced in Ebonyi state and has the highest cost in the zone to be 30000 and 40000 respectively. Enugu state has the least cost of tillage operations, this could be attributed to their soil that is rich in coal, hence, reduce agricultural activities.

Figure 6.8: Cost of Tillage Operation in the South East Zone

Generally, the cost of tillage operations across Nigeria was found to have increased. The reported increase could be associated to the increasing number of Nigerians that engages in agricultural production, Government policies that encourages the practice of agricultural production, and the awareness of value addition to agricultural produce.

6.6 Grain Reserves

Farmers have recognized the need to manage stocks of grains to prevent starvation in times of scarcity. Grains are stored in traditional and modern storage structures which are rhumbu, barns and silos (Plates 6.8 and 6.9).

Plate 6.8: Traditional Storage Structures for Grain Reserve

Plate 6.9: Modern Silos for Grain Reserves

Strategic grain reserves also known as “*emergency food reserves or food security reserves*” is a Federal Government programme that encourages the reserves of grain during glut period to be used during period of scarcity. Modern storage structures (Silos) of varying storage capacities have been constructed across the country. The storage capacity, status of completion, and location are presented in Table 6.20 as provided by Food and Strategic Reserves Department. The grain reserve is available in

almost all states of the federation at different storage capacities, ranging from 10,000 metric tons to 100,000 metric tons.

In the North East zone, only Gombe state silo is operational at a capacity of 250,000 metric tons. The silos in Jigawa and Kaduna state at the North West zone have operational capacities of 25,000 metric tons each. The North Central silos are located in Benue, Kwara, Niger and Plateau state with 25,000 metric tons operational capacities. In the South West zone, Ondo and Oyo states have silos that are operational with 25,000 metric tons each, while each of Anambra and Ebonyi states in the South East have operational silos with 25,000 metric tons capacity. Cross River and Edo state in the South South zone also have two operational silos with 25,000 metric tons each.

Other states that has silos of 100,000 capacities are Kebbi, Abuja which has been completed, Zamfara, Imo and Bayelsa are 90%, 73% and 55% completed respectively. Some states have their grain reserves strategies with capacities sufficient to cater for their states. Few among these states are Kebbi, Adamawa, Bauchi, Gombe, Katsina, Osun and Rivers states.

7.0 COST OF PRODUCTION OF MAJOR CROPS PER HECTARE

The crops considered were classified as cereals and legumes, roots and tubers, fruits and vegetables. The crops captured include maize, cowpea, ground nut, rice, sorghum, millet, cassava, yam, tomatoes, okro, and pepper. The cost of producing these afore-mentioned crops was considered per hectare.

7.1 Cereals and Legumes

Cereals and legumes are staple crops commonly grown in Nigeria. They have the tendencies to be cultivated under rain fed and irrigated farming. Crops considered in this survey are maize, rice, millet, sorghum, cowpea, ground nut and melon.

The cost of producing of producing maize, cowpea and groundnut in the North east zone generally increased when compared with 2017 (Table 7.1). Maize being a staple crop generally recorded an increase, Adamawa, Bauchi, Borno and Yobe reported a cost of producing maize in 2018 to be 150000, 180000, 215000 and 78000 respectively as against the cost reported in 2017 that was 140000, 180000, 206000 and 75000 respectively. Only Gombe reported a drop in the cost of producing maize with a percentage change 8.52% and Borno also reported a drop in the cost of producing groundnut with a percentage change of 54.8%.

The cost of producing maize, cowpea and groundnut in the Northwest Zone was reported to increase generally across the states of the zone. The percentage increase was highly significant between 2.59% and 25% (Table 7.2).

In the North Central Zone, all the states also reported an increase in the cost of producing major cereals and legumes. Though, Kwara and Taraba state reported a decrease in the cost of producing maize in 2018 when compared to 2017. The percentage decrease for these states were 1.3% and 40% respectively (Table 7.3).

The cost of production in the Southwest zone increased for maize, melon, cowpea and groundnut. In Ekiti, Lagos and Ogun states there was a general increase in the cost of producing cowpea, and maize respectively. Ondo state has a uniform cost of producing maize and cowpea in 2017 and 2018 to be 150,000 and 170,000 respectively (Table 7.4).

Maize and groundnut were the crop with data in the South east zone. The cost of producing maize in Abia, Ebonyi, Enugu and Imo increased, while the cost of producing groundnut in Ebonyi reduced in 2018. The cost was 100,000 in 2018 and 120,000 in 2017 amounting to a percentage change of 16.67% (Table 7.5).

Akwa Ibom, Cross River, Delta and Edo states in the south south zone, the cost of production for maize, melon, cowpea and groundnut generally increased in 2018 (Table 7.6).

Rice, sorghum, wheat, soybeans and millet are another important cereals and legumes crop planted. Adamawa, Bauchi, Gombe and Yobe. Though, a single digit percentage increase (6.9%) was reported for rice in Adamawa, Gombe and Yobe while Borno reported a percentage decrease of 10.3%. A decrease was also reported in Borno for sorghum. Cost of production in 2017 was 164,000 and in 2018 it was reported to be 154,000. The decrease could be associated to the resettlement of the people after curbing the Boko Haram activities in the region. Inadequate and irregular circulation of farm inputs could be another associated reason (Table 7.7).

In the North-west zone, Kaduna, Katsina, Kebbi, and Sokoto states reported crop production estimates per hectare for rice, sorghum and millet. Katsina state reported the highest cost of producing rice in 2018 which is 225,000, followed by Sokoto, Kaduna and Kebbi that produces for 218000, 216000 and 215,000 respectively. No decrease in cost of producing these crops was reported in the zone, rather, Kebbi state reported a steady cost of producing sorghum and millet in 2017 and 2018 (Table 7.8).

Table 7.4: Cost of Producing Cereals and Legumes in the South West Zone

The cost of production in the north central as presented by FCT, Kwara, Nassarawa, Niger, Plateau and Taraba. FCT, Niger and Plateau reported an increase in rice production by 8.7%, 11.11% and 3% respectively. Conversely, Kwara and Taraba state reported a drop in the cost of rice production by a percentage change of 2.9% and 28.26% respectively. The cost of producing sorghum and soybeans in Taraba also dropped by a percentage change of 3.57% and 26.83% respectively. This drop could be associated to the menace of kidnapping within some farm areas in the state (Table 7.3).

Cost of producing rice in the south west zone was majorly reported. Results indicated a general increase in the cost of producing rice with highest cost of N339,820 reported by Ogun state in 2018 and the lowest cost of N200,000 was reported by Ekiti in 2018. Cost of producing soybean was reported by Ekiti and Oyo state with an increase. The cost of production in 2017 for these two states was N19,500 and N11,900 while in 2018, it was N200,000 and N129,000 respectively (Table 7.4).

The cost of producing rice was the only crop reported in the south east zone. Abia, Ebonyi and Imo state reported a cost of production for 2018 as N380,000, N450,000 and N300,000 respectively a percentage increase of 35.7%, 12.5% and 36.6% respectively. Sorghum, wheat, soybeans and millet are not mostly produced in the zone (Table 7.5).

Bayelsa, Cross River and Edo state reported the cost of production for rice. Interestingly, there was an increase in the cost of production within these three states. A percentage increase in the cost of producing rice were 12.1%, 40% and 18% in Bayelsa, Cross River and Edo state respectively (Table 7.6).

Figure 7.1: Average Cost of Producing Maize and Rice in Nigeria

The cost of producing maize and rice in 2018 reportedly increased slightly when compared to 2017 (Figure 7.1). The least producing zone in 2018 was south west zone with an average cost of production of N130,000 and N131,500 for maize and rice respectively. There happen to be a slight decrease in the average cost of production in 2017 which was N160,740 and N189,900. The highest cost of producing maize and rice in 2018 was recorded in the south south zone followed by south west zone and northwest zone. The average cost of production for rice and maize was reported to be N355,000 and N300,000 in the south south, N300,000 and N220,000 in the south east zone and N218,500 and N204,875 in the northwest zone respectively.

Roots and Tuber Crops

Roots and tuber crops include cassava, yam, sweet/irish potatoes, carrots, onions and others. Roots and tuber crops are mostly grown under rain fed condition. Crops considered in this APS are cassava and yam.

The cost of producing roots and tuber crops was considered across all zones in the country. The roots and tuber crops considered were cassava and yam. However, zones that reported these crops were north central, south west, south east and south south. In the north central, Benue, FCT, Kwara, Niger, Plateau and Taraba states provided information on the cost of root crop production. Generally, it was reported in the zone that there were increase in the cost of production. Taraba state has the highest cost of producing cassava in 2018, reported to be N240,000, closely followed by Benue N200,000. More so, the cost of producing yam in the zone generally experienced an increase. Plateau state reported the highest cost of production of N606,000 in 2018 as against N589,000 in 2017, Niger state followed with N850,000 in 2018 and N800,000 in 2017 (Table 7.7).

Table 7.7: Cost of Producing Roots/Tuber Crops in the North Central/Ha

State	Cassava			Yam		
	2017	2018	% Change	2017	2018	% Change

Average	133642.9	155247.7	15.10286	374250	379778.3	4.09

In the south west zone, Ekiti, Lagos, Ogun, Ondo, Osun and Oyo states reported cost of production for cassava and yam. Quite a number of states reported an increase in the cost of producing cassava and yam. Ogun state reported the highest cost of producing cassava in the zone in 2018 which was N330,000 and Ondo reported the highest cost of producing yam with a value of N500,000 (Table 7.8).

Table 7.8: Cost of Producing Roots/Tuber Crops in the South West Zone/Ha

Average	212383.3	236083.3	10.61	427900	408523.3	6.482

In the south east zone, Abia, Ebonyi, Enugu and Imo reported cost of production for cassava and yam. The costs reported were found to be generally on the increase across these states. Ebonyi reported the highest cost of producing Yam in 2017 and 2018 amounting to a cost of N600,000 while Enugu reported the cost of producing cassava in 2017 and 2018 to be N347,000 and N359,100 respectively (Table 7.9).

Table 7.9: Cost of Producing Roots/Tuber Crops in the South East Zone/Ha

	Cassava			Yam		
State	2017	2018	% Change	2017	2018	% Change
Abia	300000	350000	16.67	390000	410000	5.12
Anambra	190000	200000	5.3	205000	210000	2.4
Ebonyi	180000	170000	5.56	600000	600000	0
Enugu	347000	359100	3.48	N/A	N/A	N/A
Imo	300000	350000	16.67	500000	510000	2
Average	263400	285820	9.536	423750	432500	2.38

The cost of producing cassava and yam in the south south zone was reported by Akwa Ibom, Bayelsa, Cross River, Delta and Edo. There was a significant increase in the cost of producing these crops in the zone. Edo state reported the highest cost of producing both cassava and yam in the zone at a cost of N290,000 and N460,000 respectively in 2018. This is followed by Cross River that has a percentage increase of 6% and 5% for cassava and yam respectively.

Figure 7.1.1b shows the average cost of producing tuber crops (cassava and Yam) in Nigeria. Though, the average cost of producing yam is much higher than cassava in all the zones studied. The north east and north west zone are not major producer of any of these crops. However, the cost of producing yam was observed to have a significant increase in south east zone N432,500, south west zone N408,523 and north central zone N379,778 in 2018 when compared to cassava that has N285,820, N236,083 and N155,247 respectively (Table 7.10). This significant increase in the average cost of producing yam could be associated to the Government initiatives, on yam exportation.

Table 7.10: Cost of Producing Roots/Tuber Crops in the South South Zone/Ha

Figure 7.1: Average Cost of Production of Cassava and Yam in Nigeria

Fruits and Vegetables

Fruits and vegetables are succulent crops that are produced mostly under irrigation. The crops considered under fruits and vegetables are tomatoes, okro and pepper.

Fruits and vegetables was reported for only south west zone. States that reported the cost of producing tomato and okro were Ekiti, Lagos, Ogun, Ondo and Osun states. There was a general increase in the cost of producing tomatoes and okro with Ogun state reporting the highest cost of producing tomato at N360,000 in 2018 and N339,500 in 2017 respectively. This is closely followed by Ekiti state with a cost of N250,000 in 2018 and N200,000 in 2017 (Table 7.11).

8.0 FOOD COMMODITY PRICES

This section reports prices of major food commodities across the country. Comparison of prices were made between January and July 2017 and the corresponding periods in 2018. As in last year, general increases in prices of most commodities were recorded across the country. Again as in the previous year, this increase in prices could be attributed to the general rise in prices in the economy. Government macroeconomic policies as well as its compliance with the ECOWAS Charter could be other reasons for the general increases in price levels. The tables for commodity prices were presented according to the 6 geopolitical zones of the country for ease of comparison.

Prices of Maize, Millet and Sorghum

Comparison of market prices of maize, millet and sorghum were made for Jan-July 2017 and Jan-July 2018 and presented in Table 9.1. Generally, the prices of maize, millet and sorghum increased across all zones except the South-East and South-South zones. There was a general decrease in maize prices when July 2017 and July 2018 prices were compared across the states. Taraba and Nassarawa recorded the highest decrease in maize prices (>50%). However, among the few states that reported increase in the price of maize over the period, Anambra state reported more than 87% increase. The highest mean decrease in maize price (33%) was recorded in the North-East Zone, while the highest mean increase

(9%) was recorded in the South-East.

Both the highest decrease and increase in millet prices were reported from the North-East Zone. Bauchi recorded the highest decrease (58%) in millet price; while Adamawa reported the highest increase of 38%. The highest mean decrease in millet price (28%) was recorded in the North-East Zone, while the highest mean increase of 11% was recorded in the South-West.

The highest decrease and increase in sorghum prices were reported in the North-West Zone. Katsina recorded the highest decrease of 64% in sorghum prices; while Kaduna reported the highest increase of 45%. The highest mean decrease in sorghum price of 36% was recorded in the North-West Zone, while the highest mean increase of 18% was recorded in the South-East Zone.

Prices of Paddy and Milled Rice

The government's tariff on imported rice as well as its policy against the importation of rice across land borders stimulated local production and processing of rice. General increase in paddy prices was recorded across the country. Both the highest decrease and increase in paddy prices were reported from the North-East Zone. Taraba recorded the highest decrease of 39% in paddy prices, while Gombe reported the highest increase of 63%. The highest mean decrease in paddy price of 8% was recorded in the North-Central Zone, while the highest mean increase of 20% was recorded in the North-East Zone.

Ebonyi recorded the highest decrease of 74% in milled rice prices, which could be attributed to the concentration of small and medium scale rice processing firms in the state. The highest increase of 85% was recorded in Zamfara state. The highest zonal mean decrease in milled rice price of 37% was recorded in the South-East Zone, while the highest mean increase of about 5% was recorded in the South-West Zone.

Prices of Yam tuber, cassava tuber and cassava garri

Increases in the prices of Yam tuber, cassava tuber and cassava garri was reported across most states. Zamfara recorded the highest decrease of 74% in prices of yam tuber. The highest increase of 230% was recorded in Lagos state. The highest zonal mean decrease in yam tuber price of 11% was recorded in the South-East Zone, while the highest mean increase of about 86% was recorded in the North-West Zone.

Both the highest decrease and increase in cassava tuber prices were reported from the South-West Zone. Osun recorded the highest decrease of 84%, while Lagos reported the highest increase of 217%. The highest mean decrease in cassava tuber price of 49% was recorded in the South-East Zone, while the highest mean increase of 50% was recorded in the North-West Zone.

Delta recorded the highest decrease of 74% in the prices of cassava garri. The highest increase of 86%

was recorded in Enugu. The highest zonal mean decrease in cassava gari price of 65% was recorded in the South-East Zone, while the highest mean increase of 25% was recorded in the North-East Zone.

Prices of soybeans and Fresh Tomato

Sokoto recorded the highest decrease of 36% in the prices of soyabean. The highest increase of 88% was recorded in Bauchi. Both highest mean decrease by 14% and increase by 10% in soyabean price were recorded in the North-West Zone. Nassarawa recorded the highest decrease of 37% in the prices of fresh tomato between July 2017 and July 2018. The highest increase of 300% was recorded in Jigawa between January 2017 and January 2018. The highest zonal mean decrease in fresh tomato price of about 4% was recorded in the South-South Zone, while the highest mean increase of about 57% was recorded in the North-West Zone.

Prices of beef, mutton and goat meat

Slight increases in the prices of beef, mutton and goat meat were also reported across the states. The highest increase of 44% was recorded for beef price in Jigawa. Adamawa recorded the highest decrease of 42% in beef prices. The highest zonal mean decrease in beef price of 8% was recorded in the North-West Zone, while the highest mean increase of 8% was recorded in the North-Central Zone.

The highest increase of 40% was recorded for mutton price in Nassarawa. Zamfara recorded the highest decrease of 33%. The highest zonal mean decrease in mutton price of 6% was recorded in the North-West Zone, while the highest mean increase of 25% was recorded in the South-East Zone.

Jigawa recorded the highest decrease of 40% in the prices of goat meat. The highest increase of 44% was recorded in Nassarawa in July 2017 and July 2018. The highest zonal mean decrease in goat meat price of 8% was recorded in the South-West Zone, while the highest mean increase of 13% was recorded in the North-West Zone.

Prices of fresh and dried fish

Slight increases were reported in the prices of fresh and dried fish across most states of the country. Sokoto recorded the highest increase of 89% in the price of fresh fish. The highest decrease of 33% was recorded in Ondo. The highest zonal mean decrease in fresh fish price of 7% was recorded in the South-West Zone, while the highest mean increase of 24% was recorded in the North-East Zone. The highest increase of 76% was recorded for dried fish price in Ebonyi. The FCT recorded the highest decrease of 20%. The highest zonal mean decrease in dried fish price of 6% was recorded in the North-West Zone, while the highest mean increase of 30% was recorded in the South-East Zone.

9.0 FARMERS' ASSESSMENT OF CROPPING PERFORMANCE

This part of the report presents the results of the 2018 farmers' assessment of cropping performance for Nigeria based on the statistical analysis performed. The results are presented in different forms including brief summaries, charts and tables in order to make it easier for users to understand.

An average of 2ha of land was cultivated by the farmers in 2018 resulting in an increase of 0.25% to the average land size cultivated in 2017. Most farmers reported that they increased their land size in the growing season. More fallow lands were open up for farming in 2018. Most farmers (52%) were involved in growing crops only, (3%) farmers reared livestock only, (0.5%) farmers kept poultry only and (0.4%) farmers were involved in fishing only. In all, (97%) were into crop production irrespective of other agricultural production. Some farmers, (35%) combine crop production with rearing of livestock while (20%) farmers were engaged in crop production as well as poultry keeping. The percentage use of improved seed was only reported by fewer farmers, since most farmers go for own saved seed from previous harvest. Majority (67%) of farmers sampled used inorganic fertilizer. Very few farmers (1%) reported to have used Single Super Phosphate (SSP) fertilizer. Fertilizer application in Nigeria by farmers is not impressive due to paucity of fund and the believe by some that their lands are fertile. 50% of the farmers also reported that they use organic fertilizer (animal manure). The application of organic fertilizers was also minimal. The organic fertilizer used among farmers were mostly cow dung, small ruminant waste (31%) and poultry waste (19%). About 10% of farmers got Government input in 2018 as compared to 2017 where only 4% of farmers got input. Fertilizer received by the Government were purchased at the cost of N5500 per 50kg bag. About 89% of farmers that received Government fertilizer reported that the quality of fertilizer was high. Some farmers (47%) reported that the fertilizer was distributed early while 53% of farmers reported that the distribution was late. Farmers' access to Government Input are shown in Figure 9.8 and 9.9. Only 2% of farmers reported to have hired Government tractor in the current season. Twenty percent (20%) were able to hire tractor from private owners. No farmer reported to have received credit from Government in 2018.

However, 3% of the farmers had access to credit which they got from cooperatives. About 52% of the sampled farmers purchased seeds in the 2018 cropping season. Fewer farmers (12%) purchased improved seed varieties. The quantities of seeds purchased varied between 10kg and 50kg. The average cost of purchased seeds was about N500. Seeds were mainly obtained from the market by 40% of the farmers while 12% of farmers purchased from seed companies and agro-dealers. Other sources were from cofarmers (7%) and farmers' own stock (41%). Farmers' sources of seed are shown in Figure 9.10. The nonseed inputs purchased in the current season included NPK, Urea, pesticides (herbicides and insecticides) and manure. Fewer farmers used non-seed inputs, suggesting the need to encourage farmers to use these inputs to enhance their productivity.

10.0. PRODUCTION ESTIMATES FOR MAJOR CROPS

Cultivated land area, production estimates and yield for major crops across the country are presented in this section

10.1. Cereals

The cereal crops include rice, maize, sorghum, and millets among others. They are mostly rich in carbohydrates and hence serve as energy foods to most Nigerians. They are regarded as staple foods in sub-Saharan countries due to the frequency of their consumption in every household. They are processed into grains and taken either cooked or further processed into other forms such as flour.

Rice

Rice is one of the major cereal crops that supply dietary energy to humans. It is a leading staple food in Nigeria with its consumption increasing at a higher rate than its production. It is grown in almost all the thirty-six states and federal capital territory. Data from the 2018 agricultural performance survey indicate that an estimated land area of about 4,065.49 million hectares was devoted to rice cultivation across the country compared with 3,764.96 million hectares in 2017. This represents an increase of about 7.98%. The increase as reported by most farmers in all the state is as a result of the government efforts in improving domestic production. For the output on the other hand, rice forecast for this year stands at 8,403.36 million metric tonnes, reflecting 7.25% against 2017 forecast of 7,835.12 million tonnes with an average yield of 2.07 tonnes per hectare in 2018 (Table 10.1). All the states reported an increase in rice output with exception of Yobe that recorded a decrease in rice output for the year 2018.

Sorghum

Both land area and production in 2018 increased compared with 2017. Total land area dedicated for sorghum increased to 5,848,460 hectares in 2018 as compared with 5,636,180 in 2017 which represent a 3.77% increase. The production forecast for 2018 increased by 4.50% from 6,431,670 MT in 2017 to 6,721,180 MT in 2018. The highest increase recorded for sorghum was in Bauchi with up to 20.63% increase in production and 19.90% increase in land area from 2017 to 2018. Some states recorded a decrease in either land area, production or both. The highest decrease was recorded in Adamawa with 7.72% in land area and 4.11% in production output. Other states that

Kogi	126.56	127.16	0.48	95.89	95.89	0.00	1.32	1.33
Benue	164.41	194.80	18.48	126.40	193.92	53.42	1.30	1.00
Oyo	58.00	58.80	1.38	48.71	48.93	0.46	1.19	1.20
Enugu	13.44	13.63	1.38	12.12	12.18	0.46	1.11	1.12
National	6431.67	6721.18	4.50	5636.18	5848.46	3.77	1.20	1.20

recorded decrease in land area include Sokoto (-0.04) and Nassarawa (-0.97). Average yield was 1.2 tons/ha in 2018 (Table 10.2).

Maize

Maize is the second most important cereal crop in Nigeria (after rice) and virtually produced across all the states of the country. The total estimated land area for the crop in 2018 was 6,021.20 million hectares as compared with 5773.62 million hectares in 2017, thus indicating 4.29% increase. The production also increased to 12,759.99 million MT in 2018 compared with 12,004.65 million MT in 2017, with percentage increase of 6.29%. An average yield of 2.02 tons/ha was recorded in 2018, which was a slight increase above 2017 (Table 10.3).

Millet

Millet is also an important cereal crop mainly grown in the Northern part of Nigeria. The crop thrives well in locations where the rainfall does not last long enough to deter its growth. In 2018, a total of

1,734,300 Ha was devoted for the crop compared to 1,676,630 Ha in 2017. In terms of production, an increase of 5.35% was realised from 1,783,970 MT in 2017 to 1,879,350 MT in 2018. Generally, there was an increase in production for all states except Zamfara and Kogi states which recorded decrease of -0.03 and -1.31 respectively. This could probably be as a result of the crisis that engulfed Zamfara state which made it difficult to cultivate and cater for the crop and the cases of flood which was experienced in part of Kogi state. The national average yield recorded for 2018 was about 1.14 tons/ha and 1.12 tons/ha in 2017 (Table 10.4).

10.2. Legumes

The legumes are very important nitrogen fixing crops that adds to soil fertility. They are grown under mixed cropping with other crops most especially the cereals. The crops include Cowpea, Soybean, and Groundnut.

Groundnut

Groundnut is an important legume crop grown mostly in the Northern part of the country. Total land area dedicated for the crop in 2018 significantly increased to 3,562,650 Ha as against 3,398,100 Ha in 2017 (an increase of 4.84%). Similarly, production output increased to 4,421,540 MT in 2018 compared with 4,247,760 MT in 2017, representing 4.09% increase. Output from the Groundnut producing states considerably increased - Niger (18.17%), Ogun (18.11%), and Katsina (14.83%) recorded the highest increase while Kaduna (-5.05%), Yobe (-2.72%) and Sokoto (-1.41%) had decrease in production output. Generally, the average national yield is 1.27 tons/ha in 2018 (Table 10.5).

Cowpea

Cowpea is a leguminous crop that is of high economic importance in Nigeria. The crop is grown in many parts of the country, especially in the north and serves as a substitute for animal protein. Nigeria is the leading producers of cowpea in Africa with not less than 60% of the total continental production. Findings showed that the crop was cultivated in an estimated land area of 4909.06 million hectares in 2018 which was higher than 4763.69 million hectares of land area used for the production of the crop in 2017, translating to about 2.96% increase. Production forecast for 2018 stood at 4007.83 MT which is higher than that of 2017 by 223,060 MT thus representing 5.89% increase. Major producing states in the country are Gombe, Taraba, Adamawa, Yobe, Kwara, Kogi and Jigawa among others. A national average yield of 0.85 tonnes per hectare was recorded for 2018 (Table 10.6).

Soybean

Soybean is one of the major crops that is grown for both food and industrial purposes. The crop is grown in many states of the country. Estimates for land area showed that 1174.83 million hectares was cultivated in 2018 as against 1119.70 million hectares cultivated last year; an increase of 4.69%. The crop output forecast for the year 2018 was 1053.56 million tonnes which is higher than 993.78 million tonnes in 2017 (Table 10.7). The increase in production output could be as a result of more demand by the poultry industry in the country that utilize soybean as major constituent in poultry feed production. Major soybeans producing states in Nigeria are; Benue, Kaduna, Gombe, Kwara, Niger and Kogi.

10.3 Oil Seeds

Benniseed

Benniseed (sesame) is an oil seed crop. It is among the leading cash crops that are grown in Nigeria which is second to Cocoa in terms of export value. The estimated land area for the cultivation of benniseed crop in 2018 was 785.80 million hectares as against the 871.45 million hectares cultivated in 2017; a decrease of 9.83%. The decrease could be as a result of diversification to other crops in the country. The production output forecast for benniseed for 2018 was 522.73 million tonnes 2017 production figure of 556.36 million tonnes, indicating a 6.04% decrease in the output (Table 10.8).

Table 10.7: Estimates of Cultivated Land Area, Production Output and Yield Forecast for Soybean

State	Production (“000” MT)			Land (“000” Ha)			Yield (tons/Ha)

10.4. Fibre

Cotton

Cotton is one of major annual fiber crop of high export value that is also grown in Nigeria. The crop is grown mostly in the northern states of Borno, Yobe, Bauchi, Gombe, Adamawa, Taraba, Jigawa, Katsina, Sokoto, Kebbi, Zamfara, Kano, Kaduna, Plateau and FCT and to some extent in Cross River. The total land area estimated for cotton production in 2018 was 556.18 million hectares which was slightly higher than that of 2017 by 0.06%. Bauchi has the largest area devoted for cotton production followed by Katsina, Borno, Kano and FCT. The production forecast for cotton in 2018 was 231.95 million tonnes as against 215.30 million tonnes in 2017, indicating 7.74% increase in the output (Table 10.9).

10.5. Root and Tubers

The diverse vegetation zones of Nigeria have made it suitable for many crops. Some adapt to the Northern ecology and others to the Southern ecology. Root and tuber crops includes Yam, Cassava, Irish and Sweet Potatoes, and Cocoyam. These crops adapt more to the Southern ecology with few northern states especially in the North Central zone. They are consumed for their starchy tubers and serves as income source for majority of household living in the root and tuber crops producing states.

Yam

Yam is the most important tuber crop grown in Nigeria making the country to contribute significantly to total tonnage among the African countries. Production increased in 2018 to about 53,428.1MT against 51,837.6 MT in 2017. i.e an increase of 3.1%. Land area cultivated increased from 6,535,430 Ha in 2017 to 6,838,860 Ha in 2018, i.e. about 4.6% increase. Generally, there was anticipation of bumper harvests in the Yam producing states though some were hampered as a result of the flood which washed away a significant production output and resulted to a lesser production as in Kogi State. A decrease in both land and production was recorded in Benue state which was probably due to the ethnic clashes in the state in the early part of 2018. The national yield indicated a decrease by 0.3% in 2018 with 8.43 tons/ha as against 8.45 tons/ha in 2017 (Table 10.10).

Table 10.9: Estimates of Cultivated Land Area, Production Output and Yield Forecast for Cotton

State	Production ("000" MT)			Land ("000" Ha)			Yield (tons/Ha)

Cassava

Cassava is virtually cultivated in all the states of the federation and is also an important root and tuber crop. There was overall increase in land area and production in the key producing states as a result of the good price the crop fetched in 2017. There was an increase in production to 58,472.34 MT in 2018 as against 55,147.06 MT in 2017, an increase of 6.03%. Cultivated land area in 2018 increased to 9,952,790 Ha compared with 9,194,940 Ha in 2017, indicating an increase of 8.24%. The continuous crisis in Zamfara in recent times has probably led to decrease in Cassava land area as well as the production of the state by 12.78% and 14.17% respectively. Generally, there was decrease in national average yield to 5.8 tons/Ha in 2018 as against 6 tons/Ha in 2017 (Table 10.11).

Cocoyam

Cocoyam is mostly consumed directly in most growing states and in few instances processed into flour. Land area cultivated in 2018 increased by 7.41% from 1,036,890 Ha in 2017 to 1,113,770 Ha. A significant increase of 6.52% was recorded in 2018 in production output with 7,999,010 tons against 7,509,160 tons in 2017. States with major production for 2018 include Imo (567.24 MT), Anambra (587.41 MT), and Bayelsa (488.23 MT). Overall national average yield has dropped by 0.56% in 2018 to 7.89 tons/ha against 7.93 tons/ha in 2017 (Table 10.12).

10.6 Spice

The major spice crop grown in Nigeria is Ginger. A number of spice crops are available in the wild. They are used in most cases dried and they add to the aroma of household meals. Ginger is the most important grown spice and Kaduna state is the major producer in Nigeria.

Ginger

Ginger production increased in general for all the states where it is grown except in Benue state where both production and land area decreased by -5.81% and -9.82% respectively. The total land area put to production in 2018 was 86,310 Hectares against 79,940 Hectares in 2017, indicating an increase of 7.97%. Production in 2018 was 677,870 MT compared to 663,190 MT in 2017 representing 2.21% increase. The average yield in 2018 was 6.10 tons/ha compared with 7.37 tons/ha in 2017 indicating a decrease by 20.82% (Table 10.13).

10.7 Vegetables

Vegetable crops include Tomatoes, Onion, Okro, Cabbage, and Lettuce among others. They are grown for their leaves and fruits and eaten cooked or half cooked. They are a major source of vitamins in household meals

Tomato

Tomato is an important vegetable crop grown across the 36 states and the FCT. Production forecast for 2018 showed an increased by 4.54% from 2809.26 MT in 2017 to 2936.87 MT in 2018. Estimated land area devoted to its cultivation in 2018 was 1,386,120 Ha as against 1,310,860 Ha in 2017, which represents an increase of 5.43%. High increase were recorded for Anambra (31.58%), Adamawa (21.43%), Zamfara (19.55%), Kano (16.69%) and Yobe (15.95%) states. The national average yield in 2018 was 2.12 MT/Ha which is less than that of 2017 (2.14 MT/Ha) (Table 10.14).

Onion

Onion is mainly produced in northern Nigeria. In 2018, an estimated land area of 549, 880 Ha was put to production lower than 550,400 Ha in 2017, signifying 0.09% decrease. Production forecast indicated a decrease by -1.12% in 2018 (1,416,950 MT) from 1,433,000 MT in 2017. Generally, there was increase in production forecast in all states except, Sokoto and Jigawa with decrease by -36.86% and -2.68% respectively. Average national yield decreased to 2.83 MT/Ha in 2018 as against 2.84 MT/Ha in 2017 (Table 10.15).

Table 10.14: Estimates of Cultivated Land Area, Production Output and Yield Forecast for Tomato

State	Production ("000" MT)			Land ("000" Ha)			Yield (tons/Ha)

Okro

The total land area cultivated for Okro increased by 7.14% in 2018 as against 1,302,200 Ha cultivated in 2017. Total production forecast showed a significant increase of 7.69% in 2018 from 1,562,000 Ha in 2017. There was increase in most states like Jigawa (31.84%), Kano (34.52%), Ogun (34.00%) but some states decreased outputs. The average national yield increased to 1.75 MT/Ha in 2018 as against 1.73 MT/Ha in 2017 (Table 10.16).

11.0 LIVESTOCK AND FISHERIES PRODUCTION IN NIGERIA

The contribution of livestock production systems to the food security of the poor and under-nourished groups is well documented. Acquisition of livestock is widely recognized as a pathway out of poverty, a major income generating activity, a financial instrument, and a means of income diversification. Achieving the Sustainable Development Goals (SDGs) in many developing countries would therefore depend greatly on the ability of developing countries to build more sustainable investments into livestock production that is capable of meeting the increasing demand for the food of animal source. Consumption of animal source foods (animal products) is reported to increase geometrically faster in developing countries (Nigeria inclusive) than in developed countries.

Over the years, livestock production has been an avenue for wealth and job creation for millions of Nigerians. The population growth in the country also necessitated the need for increasing growth in investments into ventures of animal production. In spite of the many contributions of livestock industry to the socio-economic development of Nigerians, the sector is limited with some issues that need urgent attentions. Principal among the factors limiting livestock production in Nigeria are:

- (i.) inadequate policy on livestock breed improvement
- (ii.) High cost of livestock feed
- (iii.) Conflicts between crop farmers and pastoralists
- (iv.) Inadequate government intervention on livestock input supplies

The chart below highlighted (as a reminder to both government and private sector) the impacts of livestock industry in effective climate change and natural resource usage; good health and adequate nutrition of the populace as well as equity and growth of the nation. Major redistribution of investments towards livestock value chain is capable of enhancing the GDP of our beautiful nation –Nigeria.

Livestock Population in Nigeria

Figures 11.1 to 11.9 show species-based livestock population in 2018. The population of cattle in the year under review was highest in Zamfara State (3,402,881) (Figure 1). The population of goats was presented in Figure 2. The highest population was found in Katsina State (6,151,776). Table 11.1 also showed the total population of livestock species in Nigeria. The total population of cattle, sheep and goats in Nigeria were 20,231,598; 45,617,072 and 79,989,657, respectively. That of chicken, pigs and rabbits were 193,578,481; 8,267,284 and 1,034,587, respectively. The total population of donkey, camel and horses were 978,402; 279,955 and 102,323, respectively.

Livestock Pests and Diseases

Cattle

Figure 11.10 and Table 11.6 show pests and diseases of cattle as observable in 2018. Contagious Bovine Pleuropneumonia (CBPP) was reported in six (6) States, all in the Northern part of Nigeria. The States where the infectious disease of lungs of cattle (CBPP) was reported were Adamawa, Anambra, Nasarawa and Taraba. Foot and mouth disease was also reported among cattle populations in many States (10 States) of Nigeria. Foot and mouth disease (FMD) is a severe, highly contagious viral disease of cattle and swine. It also affects sheep and goats. It affects cattle in Adamawa, Bayelsa, Gombe, Katsina, Osun, Oyo, Rivers, Sokoto and Taraba States. Other diseases and pests that affect cattle in Nigeria in 2018 were babesiosis, fascioliasis, foot rot, helminthiasis, rinder pest, tick infestation and tuberculosis.

Diseases of Sheep, Goats and Poultry

Pests and diseases that affected sheep, goats, poultry and swine were presented on Tables 11.7 and 11.8. Peste des petits ruminants (PPR) affected sheep and goats in all the agro-ecological zones in Nigeria. The disease was reported to affect sheep and goats in 16 States: Abia, Adamawa, Anambra, Benue, Ebonyi, Edo, Gombe, Imo, Kano, Katsina, Nasarawa, Niger, Osun, Oyo, Plateau, Taraba and Rivers State. Figure 11.11 shows the estimated loss of sheep and goats to PPR disease in 2018. Other pests and disease that affected sheep and goats in 2018 were fleas, foot rot, helminth worms and mange.

Figure 11.11: Estimated loss of sheep and goats to peste des petits ruminant disease in 2018

Newcastle disease (NCD) affected poultry in nearly all the agro-ecological zone of Nigeria. The disease was reported to have affected poultry in Adamawa (North East), Kaduna and Kebbi (North West), Kwara and Niger (North Central), Ondo and Osun (South West) and Rivers State (South South). Other diseases that affected poultry include gumboro (infectious bursal diseases), coccidiosis and chicken pox. Avian influenza affected poultry in Nigeria in 2017. A new strain of the disease, popularly known as bird flu, entered Nigeria in January 2017 and spread to 26 States and the Federal Capital Territory, with over 3,500,000 birds affected. Nigeria's outbreak of highly pathogenic H5N1 avian influenza, initially confirmed at a single farm on 8 February 2017, spread to several parts of the

country. Outbreak was detected on more than 130 farms in 11 of the country's 36 States. Control measures on farms had included culling, disinfection and safe disposal of carcasses.

Livestock Inputs Procured and Distributed in 2017 and 2018

Table 11.10 showed the comparison between the livestock production inputs procured and distributed among the States of Nigeria. Records of livestock inputs from 14 States of the country were presented. Drugs and vaccines were prominent among the inputs procured and distributed in 2017 and 2018. Contagious bovine pleuropneumonia (CBPP), peste des petits ruminants (PPR), Newcastle disease vaccine (NCDV), infectious bursal disease vaccine (IBDV), fowl pox vaccines, anti-rabies vaccines were purchased and distributed by Adamawa, Gombe, Taraba, Osun and Bayelsa State. Drugs for fowl cholera, fowl typhoid and drugs for other livestock diseases were purchased by Kaduna, Bauchi and Taraba States.

Investments were made into the procurements of various livestock feed ingredients, equipment and the actual animals in terms of day old chicks, yearling bulls, turkey poults, weaner stocks of rabbits and pigs as well as stocks of sheep and goats. It is of note that the exact quantity of livestock inputs procured and distributed in Bayelsa, Benue, Enugu, Kaduna and Oyo State were not provided by relevant authorities.

Table 11.11 depicted the recorded cases of farmers-pastoralists conflict and the extent of damage caused. The reports for this phenomenon were documented for 16 State that provided information for the 2018 Agricultural Performance Survey. The 16 States cut across all the agro-ecological zones of the country. Various numbers of livestock, properties and human life were reportedly lost during the attacks emanating from the farmers-pastoralists conflicts.

Information on cattle rustling and the extent of losses caused in Nigeria during 2018 agricultural season was shown in Table 11.12. Cattle rustling was reported in all the agro-ecological zones with the exception of the South South Zone. The phenomenon was reported by 11 States with various level of occurrence. In Sokoto State, 1,500 houses were reportedly burnt due to the activities of cattle rustlers which also claimed some 300 people. Occasional cattle rustling attack also occur in Adamawa, Anambra, Enugu, FCT, Gombe and Osun States. Taraba State however reported very frequent occurrences of cattle rustling.

Kidnapping in and around farms also had very high tendency towards disrupting agricultural activities. Table 11.13 provided information on kidnapping and the extent of losses caused.

Stakeholders' Recommendations on Mitigation of Pastoralists-Farmers Conflict, Cattle Rustling and Kidnapping

The following recommendations were provided to mitigate pastoralist-farmers conflict, cattle rustling and kidnapping by stakeholder of livestock agriculture:

- ❖ Implementation of anti-grazing law and establishment of ranches.
- ❖ Ranching should be encouraged
- ❖ Provision of quick response whenever the issues arise. Provision of enlightenment on the ills of the issues.
- ❖ Proper youth empowerment by engaging them in agricultural practices to boost the food sector of the economy
- ❖ Re-establishment of National Stock Route.
- ❖ Empower community leaders towards reconciliation among farmers and pastoralists.
- ❖ Production of pastures in our rangeland.
- ❖ Improve security and strict compliance with existing laws.
- ❖ Job creations.
- ❖ Formation of farmer grazer conflict resolution committee.
- ❖ Enlightenment of stockholders.
- ❖ Poverty alleviation programs by the government and NGO.
- ❖ Payment of compensation for resettlement of pastoralist in grazing reserves
- ❖ Appointment of leaders of herdsmen in every local government area.
- ❖ Profiling names of herders in every community or LGA

Livestock Related Facilities in Nigeria

Table 11.14 showed livestock related facilities in Nigeria. The bulk of functional tanneries in Nigeria are located in in the North West Zone. However, all the States covered in this report have large numbers of abattoirs and slaughter slabs.

Table 11 .14: Livestock related Facilities in Nigeria

Fisheries Production Estimates

Data on fish production estimate is presented in Table 11.15 and 11.16. Fisheries productions for the year 2018 were based on fish culture and capture fisheries, fourteen (14) states provided data on aquaculture, out of which only four (4) states Bauchi, Ekiti, Abia and Akwa-Ibom provided information both on aquaculture and captured/artisanal fisheries respectively. Bauchi and Oyo States recorded 10% and 7.2% increase in fish culture production respectively in 2018 compared to 2017, this increase in production could be attributed to the support provided by the various state government for fisheries inputs, however, the 62% decrease in production by Akwa-Ibom State is high compared to other States, this may be as result of inadequate data and or lack of support by the state government in terms of aquaculture inputs.

Similarly, the 61% reduction in the artisanal fish production in Akwa-Ibom State in 2018 when compared to 2017, may be attributed to inadequate data provided as it was stated that data made available was only for the first and second quarter of the season. Ekiti and Bauchi States experienced 5.8% and 1% increase in 2018 which is slightly above 2017. The absence of data from other states may be likely due to unavailability of vital information.

Fisheries Pest and Disease Situation

The 2018 APS revealed that all six (6) Agro-ecological zones recorded different cases of pest and diseases in fish as shown in Table 11.19. Generally, the catfish, *Clarias gariepinus* has widespread infection of diseases in all zones. Such diseases include broken skull, swollen belly, Fin rot, white patches on the skin and barbels, and bruised mouth. In the North-East, Adamawa State recorded heavy infestation of fin rot with an estimated loss of 50%. There were however, no control measures reportedly taken on fish pest and diseases in all zones. The major causes of pest and diseases in aquaculture are mainly due to inadequate and poor water quality, poor management practices and lack of manpower in the area of disease diagnosis and treatment. Therefore, it is recommended that capacity development for extension workers in the area of fish disease prevention, diagnosis and treatment should be organized so as to enable step down training of fish farmers on improved management practices to forestall stock poor growth and mortalities.

Table 11.19: Fish Pests and Diseases

State	Type of fish	Pests or disease	Location of incidence	Severity	Estimated losses (%)	Remarks/ Government intervention
North-East						
Bauchi	Catfish Tilapia	Fish louse Swollen belly	Gubi farms	Mild	21 11	
Gombe	Clariasspp	Bacterial infection	Dadinkowa	Mild	1%	
Adamawa	Clariasspp	Fin rot		Severe	50%	
North-West						
Kaduna	<i>Clariasgariepinus</i>	Broken skull	Kaduna south	Mild	4%	-

Abia	Catfish	Bacterial infection Fungal infection	Isiala	Mild	10 3	

Procurement and Distribution of Fisheries Production Inputs

There was no information on aquaculture and capture fisheries inputs procurement and distribution in most of the states and where such information were provided, they were very scanty. This dearth in information is likely due to inadequate data collation, improper handling of records and possibly lack of funds and personnel for data collection.

Out of the thirty six (36) states and the FCT, only six (6) states procured and distributed different kinds of fisheries inputs in 2018 (Table 11.18). The FCT procured and distributed cold store, smoking kiln and fish tanks at a subsidized rate of 50% to farmers, however, Ebonyi, Kaduna, Imo and Ondo State procured and distributed catfish fingerling and fish feeds.

Table 11. 18: Fisheries Input

Zone	Type of input	Quantity procured		Quantity distributed		Remarks
		2017	2018	2017	2018	
North- Central						
Gombe	Fishing nets Lead weight Floats Twine Ropes	10 bundles 30 sheaths 200pieces 50 roles 32 roles		10 bundles 30 sheaths 200pieces 50 roles 32 roles

Fish Markets in the States

Fish markets in the states for the year 2018 was classified under fresh and smoked fish traded as shown in Table 11.19. In the North-East only Bauchi State presented data for quantity of fresh and smoked fish traded. *Clarias gariepinus* was the only cultured fresh and smoked fish traded in 2018 which is slightly lower than in 2017. In the captured fisheries Clarias, Tilapia, Alestes and Heterotis were traded both as fresh and smoked fish in 2017 and 2018. Tilapia accounted for 35% of the fresh and 28% for smoked fish traded in 2018 making it the dominant species traded in Bauchi State. This may be likely due to availability and lower price compared to other fish species traded. There was an increase in the fish traded in Niger and Katsina States for fresh and smoked fish in both cultured and captured fisheries in 2018 compared to 2017. Imo and Ebonyi States had increases in the fresh and smoked fish traded both for captured and cultured fish in 2018 compared to 2017. Similarly, Oyo and Osun States had increases in the fish traded for cultured and captured fish in the year under study. Generally, more fish species are traded from captured fisheries than cultured fish in all the states. This invariably means that there is pressure on wild fish in capture fisheries. It is therefore recommended that aquaculture inputs should be made available to farmers at subsidized rates to enhance fish production in all the states.

Table 11.19: Fisheries Markets in the State

States	Quantity of fresh fish traded (Mt)		Quantity of smoked fish (processed) fish (Mt)		
	2017	2018	2017	2018

12.0 ADPEXTENSION ACTIVITIES IN 2018

12.1 ADP Funding Situation

Adequate funding is the backbone of efficient extension services. Since the withdrawal of World Bank counterpart fund, State Governments has been the major source of fund for the ADPs. Table 12.1 presents the summary of the 2018 funding status of ADPs throughout the country. In 2018, only Katsina (100%) Lagos (86.6) and Abia (58.3) State recorded over 50% of the target fund. Most States recorded less than 20% achievement. Taraba, Bauchi, Benue, Nasarawa, Ekiti, Imo, Ebonyi recorded 0% achievement of target fund. Generally, there was decline in funding compared to 2017.

12.2 Performance Indicators of ADPs

Table 12.2 indicates the performance indicators of ADP extension activities. The indicators are number of farm families reached, number of extension workers, village extension agents' visit, technology dissemination strategies (OFAR, MTP, SPAT), technology/Knowledge Sharing, transfer and feedback (MTRM and FNT), farmers' Group Development and training, extension agent: farm family ratio, training of farmers and farmer field schools (FFSs) activities.

12.2.1 Number of Farm Families Reached

Farm families are the basic unit of agricultural technology uptake. Increased support for agriculture is expected to lead to increased number of farm families who are engaged in agriculture. The number of farm families reached by the ADPs depends on the number of extension agents as well as their mobility. Kano state reached the highest number of farm families, with 1,620,000 followed by Bauchi (987,925), Katsina (965,536), Niger (816,575), and Akwa-Ibom State (685,095). Bayelsa recorded the least of 95,465 farm families. Compared with 2017 figures, only Ebonyi and Cross-River states recorded slight improvements in the number of farm families reached.

12.2.2 Number of Extension Workers

Adequacy in number of active and well-trained extension agents determines the effectiveness and efficiency of extension services. Bauchi has 185 VEAs while Gombe has 42. Generally, there was decrease in the number of VEAs from 2017 to 2018 across the nation's ADPs. However, the federal Government intervention through the N-Power (Agro) has assisted in boosting the number of frontline extension agents across the country. The number of SMSs, BESs and BEA (WIA) has been relatively steady. The distribution of EAs across Nigeria is shown in Figure 12.1.

Figure 12.1: Distribution of extension agents across Nigeria

12.2.3 Village Extension Agents' Visit

Extension agents' contact with farmers remained the major medium of sharing ideas and information on modern agricultural practices. Teaching and learning becomes more effective as it affords opportunity for demonstration of methods and results. Provision of tangible mobility is the essential facilitation to enhance regular visit of VEA's to farmers. In 2018, Kano and Gombe states recorded 885,456, and 16,320 visits, respectively, to farmers. Generally, VEA's visit to farmers declined from 2017 to 2018.

12.2.4 Technology Dissemination Strategies (OFAR, MTP, SPAT)

On-Farm Adaptive Research (OFAR), Management Training Plots (MTP), and Small Plot Adoption Techniques (SPAT) are the major strategies adopted by the ADPs to disseminate proven technologies to farmers. The use of these strategies requires provision of inputs and adequate mobility and efficient supervision. The number of OFAR, MTP and SPATs established is on the decline compared to 2017 record.

12.2.5 Technology/Knowledge Sharing, Transfer and Feedback (MTRM and FNT)

The Monthly Technology Review Meeting (MTRM) and the Fothnightly Training (FNT) are the major avenue for technology sharing/transfer as well as serving as opportunity to receive feedback from farmers to the research institute. In 2018, record obtained revealed very poor linkage of extension with research as most states could not hold MTRM and FNT.

12.2.6 Farmers' Group Development and Training

Formation and management of farmers' group is an essential role of the ADPs. Farmers' group serves as a medium of enlightenment as well as giving farmers the opportunity to relate with one another for higher productivity. Lagos state recorded the highest (485) number of farmers' group formed in 2018.

12.2.7 Extension Agent: Farm Family Ratio

The number of extension agent to farm families is a measure of ADPs' efficiency to effectively reach all farm families. EA: farmer's ratio is consequent on number of extension agents. The desired 1 EA:1000 farmer's is far from being realized as reports from all the states indicate very high EA:Farmer's ratio. Kano. Rivers state recorded 1:18,429 while Ondo State recorded 1:6600.

12.2.8 Training of Farmers

Regular training is important to build the capacity of farmers by sharpening their practical skills to enhance higher productivity. Across the state ADPs, record shows that the number of farmers' training conducted has declined from 2017 record.

12.2.9 Farmer Field Schools (FFSs) Activities

The farmer field schools provide a platform for experiential learning and encourage farmer-to-farmer information sharing. State ADPs were expected to establish and manage FFSs. Cross River, Jigawa and Lagos states had the highest number of FFSs recording 166, 109, and 81 respectively.

12.3 Challenges of ADPs in Nigeria

Major challenges hindering efficient performance of the ADPs include poor funding, inadequate staffing, and inadequate transportation/utility vehicle affecting virtually all states. Others include inadequate extension material (Input), high EA:farmer ratio, inadequate allowances, inadequate training, poor media services.

NGOs

Table 12.5 shows the 2018 assessment on NGOs level of participation in agricultural extension activities in all the six agricultural zones. Among the states, that provided data, Jigawa has highest number four (4) different NGOs engaged in the North West, Bauchi state in the North East and Lagos and Ogun States in the South West. Most of the NGOs participated in provision of interventions in the promotion of crop commodities, extension services on crops, fisheries and livestock, trainings, farm inputs supports, product development and youth and women empowerment activities. Both local and international Organisations that are prominent included SASAKAWA G2000, OXFARM, ACTION AID, AGRA and Women for Women among others. Also, international donor agencies and research institutes such as FAO, IFAD, ICRISAT, IITA and UNICEF have supported agricultural extension activities in various aspect.

Table 12.5.: NGOs Participation in Extension Activities in States

Problems Needing Research

The 2018 survey identified problems needing research/interventions as presented in Table 12.6. Problems in the areas of crops, livestock, fisheries, irrigation, agroforestry and mechanisation were enumerated. Majority of the states in the South-South and South East zones indicated areas of research on crop pest and diseases control, fish feeds formulation and alternative sources from local raw materials, snail feeds formulation and high breeds of fingerlings and small ruminants' animals. The major problems needing research interventions in the North West and North East were livestock and crop disease control, irrigation water management techniques, strategies to mitigate effect of flooding on agricultural productions and fish feeds formulations. The North central reported needs to research on conflict resolution between farmers and herdsmen.

Table 12.6: Problems Needing Research in each state

NORTHWEST ZONE		
States	Problem	Areas needing research
Zamfara	Livestock	Livestock diseases preventive measures
	Irrigation	Water management techniques
Katsina	Fish	Improved highly prolific fingerlings production Fish feeds formulation
	Crop	Control of Tuta absoluta Seed spacing and recommendation
Kebbi	Livestock	Livestock disease control and prevention
	Crop	Strategies to mitigate effect of flooding on agricultural production Areas of biotechnology
	Extension	Extension value chain
Kaduna	Crop	Improve farmers skill on modern preservation techniques
	Livestock	Disease and pest control in ruminants
		Poultry feed formulation
	Fishery	Feeds formulation

Kano	Extension	Value chain extension delivery system
		Innovation platform
Jigawa	Crop	Drought Tolerance Grains High yielding crop varieties Disease and pests resistant crop varieties
Sokoto	Extension	e-extension extension methodology
NORTHEAST ZONE		
States	Problem	Areas needing research
Adamawa	Poultry and livestock	Improved breeds of poultry Adaptable pasture seeds
Gombe	Crop	Adoption studies on insect resistant on tomato crop
	Irrigation	Effects of soil saline soil on crops
	Livestock	Local raw materials as feed ingredients
Genetic improvement of local breeds		
Bauchi	Crop	Effective striga control technology
		Determination of drought resistance and early maturity crop varieties
		Heat tolerant tomato variety development
		Determination of soil nutrients availability
	Fishery	Cross breeding of Hetrobranchus/clarias
		Fingerlings production breeding
Mechanisation	Effects and availability of power tillers on crop production	
Borno	NA	NA
Yobe	Crop	Adaptation to various ecology and storability of crops, pest and diseases
	Livestock	Livestock feeds
	Fish	Fish feeds and fisheries disease
	Mechanization	New improved machineries for planting processing and storage
NORTH-CENTRAL ZONE		
States	Problem	Areas needing research
Kwara	Livestock	Resolve conflict between herdsmen and farmers
		Hydroponic pasture production
	Fish	Feeds formulation using local raw materials
	Crop	optimum fertilizer utilization techniques
	Extension	Extension communication development
Kogi	Crop	Establishment of OFAR
	Fishery	Improved cat fish species production techniques
	Livestock	Improved breeds resistant to diseases

Niger	Crop	Rice spacing and farm layout techniques
SOUTHWEST ZONE		
States	Problem	Areas needing research
Ondo	Irrigation	improved farm machineries
Oyo	Crop	Army worms control techniques
	Fish	Feeds formulation
Ekiti	Crop	Control techniques in Fall army warm in maize
	Livestock	In breeding techniques Rabbit Production
	Fish	Fish feed formulation
Lagos	Crop	Prevention and control of army worm
		Prevention and control Die back in tomatoes fruit
	Livestock	Alternative cheap sources of energy and protein in feeds
	Fish	Alternative cheap sources of energy and protein in feeds Cheap and adaptable WESAFU(Tilapia)
	Agroforestry	Appropriate fertilizer requirement for tree crops (kolanut, citrus)
Ogun	Crop	Effective control of army warm on maize
		Effective weed control measures in rice production
	Livestock	Up-grading of sheep and goats with emphasis on nutrition
	Fish	Value addition in fish production
	Mechanization	Simple farm machineries for farm operations
Osun	NA	NA
SOUTHEAST ZONE		
States	Problem	Areas needing research
Enugu	Crop	Cocoyam infestation
	Livestock	Improvement to cross breed local goat with exotic breed
	Fish	Production of feeds
	Irrigation	Local sources for fabrication equipment
Ebonyi	Crop	Line transplanting
		African gull midge in rice
		Stem borer prevention and control
	Fish	High breed of fingerlings
		Fast maturity and fertility of fish
		Feeds formulation

Imo	Crop	Prevention and control of cocoyam leaves and root rots
		Cocoyam leave and root rots
	Livestock	Improved up -grading of livestock and feeds
Anambra	NA	NA
Abia	Crop	Prevention and control of fall army worm
	Fishery	Alternative sources of fish feeds
SOUTH-SOUTH ZONE		
States	Problem	Areas needing research
Rivers	Livestock	Optimum combination levels of concentrate feeds and forages in the reproductive of rabbits
	Fish	Breeding and Stocking of fingerlings on brackish water
	Agroforestry	Improved Quality Honey bee keeping and Production
		On-farm evaluation of Neem leaf extract as an alternative insecticide for production of Telferia
		Evaluation and economic value of Nypa-Palm
Cross Rivers	Crop	Correct formulation and dosage for crop pest control
	Poultry	feed formulation for heat stressed birds
	Fish feeds	Aquaculture production using local ingredients
	Extension	Need assessment survey extension communication technique and skills
Bayelsa	Crop	Storage of cocoyam
	Fish	Improved Fingerlings production
		On farm evaluation of enriched sweet potato
Livestock	Snail feeds formulation	
Akwa Ibom	Livestock	Snail feeds from local raw materials
Delta	Crop	Control and prevention of Army worm on maize
		Control and prevention of black siga toka disease in plantain
		Control and prevention of Tuta Absoluta in tomato
Edo	Fish	Feeds Formulation
	Agroforestry	Best practice of vegetative propagation
		Adoption of Agro -Forestry technology e.g. use of leguminous plant as hedge roll
	Irrigation	Water rate requirement for various crops Irrigation management in rice fields
	Mechanisation	Use of mechanical weeder
Mechanized palm oil production for small palm oil processor		
	Extension	Mainstreaming (CDD) community Development Driven in Extension

Source: NAERLS, Agricultural Performance Survey, 2018

Training Needs

The 2018 training needs of ADPs across all the zones are presented in Table 12.7. Majority of the states indicated capacity building in extension communication skills, ICTs, improved mushroom production techniques, green house farming techniques and post-harvest and processing equipment handling techniques, agribusiness and value addition, operation and maintenance skills of irrigation equipment were the major areas needing interventions. The category of staff requiring the trainings ranges from management cadre to extension agent's states. Some states were not precise in the nature of training required by their staff, as they only mentioned short- and long-term trainings.

Table 12.7: Trainings and Training Needs in Nigeria

NORTHWEST ZONE				
States	Training Subject Matter	Category of personnel in need of training	Number of personnel	
			2017	2018
Zamfara	Pest control techniques	Extension agents		50
	Livestock production techniques	Extension agents		25
	Training in value chain	SMS/EAs		40

Media programmes

The 2018 agricultural performance appraised media programmes proposed and the level of achievements recorded by the ADPs across the zones. Most State ADPs proposed and sponsored weekly radio programmes on agricultural activities (Table 12.8). The cost of airing the programmes varies from one state to another with an average of 1.2million to 2.0million per annum. The average aired duration was between 25-30mins, FRCN and other states owned radio stations were the major stations airing the programmes. Information on production, market, value addition and farm inputs were some of the messages aired to the farmers. Apart from the radio, social media platform such as WhatsApp are also used occasionally for extension activities. However, television and radio as means of extending information are still relevant and more perceived by farmers in most states. Major challenges for not using social media platform were attributed to poor network in some rural areas which might Limits farmers access to the platform.

Table 12.9a: Special FG intervention in agricultural activities

Type of intervention	States	Major activities	Total Number of beneficiaries deployed as at 2017	Number of beneficiaries as at 2018	Major challenges	Efforts to reduce challenges
Agro-N Power	OYO	Extension activities	1,637	1661	Difficulty in enforcement of discipline	Advisory role
	RIVERS	Teaching of technological recommendations in crop, livestock and fisheries	1,557	3,195	Funds for practical logistics	Complaint reported to appropriate authorities
	OGUN	Extension activities	849	660	Inadequate training facilities/venues	ADP provided alternative venue
	ABIA	Extension activities	630	2,394	Deployed Participants are not members of the community	Redeployments of participants
	NASARAWA	Extension activities	883	2496	Funds	
	LAGOS	Extension activities	1,964	2,083	Late reporting of beneficiaries to duty	Focal officers to working hand in hand with ADP
	GOMBE	Extension activities	497	1,288	Beneficiaries were concentrated in states capital	Posting to rural areas

	BAUCHI	Extension activities	1,196	3,445	Inadequate supervision	Monthly interactions
	ONDO	Dissemination of agricultural information	813	640	NA	NA
	DELTA		1,206	4453	Skill gaps Cultural variation	Fortnightly trainings

The 2018 surveyed FG special interventions in agricultural activities. From the states that provided information on level of engagement of Agro-N Power programme, most of the beneficiaries are involved in agricultural extension activities such as teaching of technological recommendations on crop, livestock and fisheries, dissemination of other agricultural activities and facilitations on farm inputs sources. Information on total number of participants deployed to each state as at 2017 compared to number of beneficiaries in 2018 were analysed. The survey showed in Oyo state, 1,637 was deployed to the state as at 2017, but 1661 beneficiaries were reported and participated in extension activities. In Delta state, 1,206 was deployed in 2017, however, in 2018 the number of beneficiaries on ground was 4453. The scheme had contributed to the extension activities of the states through extension agents' contact with farmers. Major challenges of Agro-N Power participants include; difficulty in enforcement of discipline, inadequate training facilities/venues, late reporting of beneficiaries to duty, inadequate supervisions and skill gaps especially non-agriculture-based participants as well as cultural variation.

Table 12.9b Special FG intervention in agricultural activities

Type of intervention	State	Targeted beneficiaries	Number of beneficiaries	Major challenges	Efforts to reduce challenges

	BAUCHI	10,000	10,117	Group formation No capacity building of farmers group	Advisory and sensitisation visits to farmers

13.0 GENERAL CONSTRAINTS TO AGRICULTURAL PRODUCTION

The general constraints or challenges to agricultural production in 2018 are presented according to their spread by states under seven (7) categories: weather, inputs, production/labour, mechanization, extension activities, agricultural broadcasts, e-extension, and insecurity.

1. Challenges of weather to agricultural activities

In recent years, issues regarding the impact of climate change (especially soil fertility, aridity and rainfall) on agricultural production have gained prominence in intellectual and development discourses. Figure 13.1 shows that there were several weather-related constraints to agricultural productivity. Severe flooding was experienced in 27 states across the country. All the states in the south-south, as well as six (6) states of the north-central were ravaged by flooding 2018. The flooding notwithstanding, about sixteen (16) states recorded prolonged dry spells, with the highest prevalence in the northwest and northeast. Moreover, out of the six (6) states that recorded poor rainfall distribution in 2018, two (2) were in the northeast, while one each was in the north-west, south-west, south-east and south-south.

Figure 13.1: Challenges of Weather to Agricultural Activities

2. Farm Input availability and accessibility

It is known that agricultural productivity level along the value chain is directly dependent on availability of quality inputs such as fertilizers, herbicides, seeds, animal stocks, fingerlings, fishing nets, etc. For the 2018 agricultural performance survey data, Figure 13.2 shows that government provided inputs (fertilizers, herbicides, vaccines) were largely unavailable in 22 states, while seeds (cuttings, seeds, stocks, etc), were not available in 20 states. Among the few states that provided the some of the inputs were not affordable to farmers; were untimely delivered, inadequate and adulterated especially for agro-chemicals and seeds.

Figure 13.2: Farm Input-related challenges

3. Production-related challenges (land, labour and diseases)

Figure 13.3 shows that the highest challenge to agricultural production for 2018 was high cost of labour (both manual and mechanical), as 34 of the 36 states and the Federal Capital Territory reported dramatic increases in costs of labour. The high cost tended to impede or limit agricultural activities/ investments. High prevalence of crop pests and diseases was also reported to be constraining production in 24 states, while high prevalence of livestock diseases was reported in 18 states of the Federation. Generally, there was widespread infestation of fall army worms and stem borers on maize and beetle attack on yam, as well as foot and mouth disease on cattle.

Figure 13.3: Selected Production Constraints

4. Agricultural Mechanization

The data on agricultural mechanization for 2018 were not too different from those of 2017, as shown in Figure 13.4. The data show that majority of farmers in 31 states and the FCT could not access tractor services due to high cost of hiring. Also, in 30 states, tractors were not available or accessible to farmers, while in 16 states poor irrigation facilities are strongly impeding agricultural productivity. This has made the Nigerian agricultural sector to be dominated by manual methods of production, processing and marketing. Such drudgery limits the prospects of the sector, making it unattractive to investors and uncompetitive as an economic venture.

Figure 13.4: Constraints of Farm Mechanization

5. Extension Services

Extension is the component for linking all agencies involved in planned development works in the agricultural sector, such as farmers, agricultural policy planners, development administrators, agricultural subject specialists, media representatives and researchers. The ultimate goal of agricultural research and technology development is utilization; hence, the underlying reason for gaining and then disseminating new research-based information is to assure it is appropriately considered for use in reaching decisions, making changes, and taking other specific actions designed to improve outcomes. This noble role is performed in Nigeria mainly by Agricultural Development Programmes (ADPs) in each state and the FCT. ADPs implement government agricultural projects through facilitation and education of farmers in utilizing improved technologies for better farm outputs.

From Figure 13.5, the 2018 situation showed that just as it has been reported since 2011, Nigeria has not fared well in adequately supporting extension service delivery, especially in the critical areas of personnel and funding. The major recurrent challenge faced by ADPs was inadequate capacity building for staff as reported by 34 states. This was followed by inadequate staffing (33 ADPs), and non-payment of counterpart fund (32 ADPs). Also, about 25 ADPs had zero fund release for the year 2018, while of the 12 ADPs that had fund released for their activities, such funds were grossly inadequate in 10 states. There was also the challenge of encroachment into ADP activities by state ministries of agriculture.

Figure 13.5: Constraints to ADP Activities

6. Agricultural Broadcast

The state ADPs have as primary mandate, the dissemination of agricultural information through conventional and news media to Nigerian farmers in the languages and formats they are familiar with. However, the near-absence of financial and other resources have constrained the ADPs in their responsibilities on agricultural broadcasts. Consequently, Nigerian farmers are largely left without the requisite information for quality agricultural production decisions. Figure 13.6 shows that all the 36 states and the FCT ADPs were not able to air agricultural programmes due to high cost of airtime, while 30 of them were constrained by lack of equipment. Also, farmers in 12 states indicated that even where such programmes (produced mainly by other organizations like NGOs) were available it was difficult accessing the channels coupled with the fact that the times of broadcast were not appropriate.

Figure 13.6: Constraints of Agricultural Broadcasts

7. E-Extension

Agricultural advisory service provision, as traditionally carried out by extension agencies is gradually being revolutionized with the advent of e-extension by using modern information and communication technologies. Therefore, the effectiveness of today's agriculture in meeting the food and economic needs of people depends largely on its ability to deliver on-time and real-time information along the value chain, with the component of immediate feedback mechanism. Figure 13.7 revealed that the ADP staff are heavily constrained in the use of e-extension channels. The major constraints are high cost of data (reported by 32 state ADPs), lack of support infrastructures (30 ADPs) and poor network connectivity (27 ADPs). The implication of this is that Nigerian farmers have very limited access to agricultural information in 2018.

Figure 13.7: Challenges on e-Extension

8. Security-related Challenge

Violent conflicts have several consequences in economic development. More often than not, restiveness, terror attacks and militancy especially in the rural areas mostly affect agricultural productivity and the cottage industry. On the other hand, intensification of agricultural development programmes leads to economic diversification, and therefore, reduction in restive agitations or communal unrests in any society. The peace action resulting from such economic progress would almost always act as incentives for more foreign direct investment and a factor for accelerating national economic growth. The results of the 2018 survey with regard to security-related challenges to agricultural productivity in the country showed that government needs to do much more in improving the security of lives and properties across the country in order to promote agricultural development. Figure 13.8 revealed that agricultural activities were heavily compromised in 25 states by the persistent crisis between herdsmen and farmers, while 10 states reported cattle rustling as a major challenge. Furthermore, farmers in 8 states asserted that communal clashes and insurgency/militancy were constraining factors to agricultural activities in the year. Although the security situation seems to have improved over that of 2017, government needs to intensify efforts and strategy in containing to the barest minimum these socioeconomic menaces that have caused farming communities to abandon their homes and farmlands.

Figure 13.8: Security-related challenges to agricultural activities

14.0 FLOOD DAMAGE ASSESSMENT IN SOME STATES IN NIGERIA

14.1 Preamble

Information obtained from 2018 Agricultural Performance Survey (APS), Newspapers, Radio and Television reported occurrence of flood in all the states of Nigeria. The National Emergency Management Agency declared 12 States along Rivers Niger and Benue as worst affected by flood disaster in 2018. The worst affected states are Benue, Kogi, Niger, Kwara, Anambra, Delta, Bayelsa, Rivers, Adamawa, Kwara, Kebbi and Taraba.

NIMET reported that torrential rain in the northern and central parts of the country coincided with higher river levels to lead to flood situations in many parts of Nigeria. Deleterious effects of human activities such as blockage of drainage systems and poor urban planning on the environment exacerbated the flooding situation in many cities. Rivers Niger and Benue overflowed their banks leaving some parts of the country exposed to large scale floods. High flow from the upper catchment of the Niger basin were reported NHSA to advance down to Nigeria, necessitating Shiroro, Kainji and Jebba Dams to spill water downstream in September. Total volume flow reported at Koulikoro (representing the Upper Niger basin, the hydrological situation) from 1st June to 31st October 2018 was about 33.21 billion m³. This volume was higher than those recorded in the years 2016/2017 and 2017/2018. A maximum flow was 4545 m³ /s observed on 6th October and a minimum of 1978 m³ /s was recorded on the 31st October 2018, while the mean flow was 3692 m³ /s equivalent of a monthly volume of 9.9 billion m³.

Lokoja station is the reference point for water situation in Nigeria and is of critical importance to hydrological decisions. The flow discharge situation in Nigeria at Lokoja has been receding with a minimum water level and discharge of 3.25m and 3390 m³/s respectively at the end of 31st December 2018. The maximum flood water level of 11.22m and discharge of 25,212m³/s was attained on 20th September 2018 in the zone of Red Alert which was higher than that recorded in 2017 but lower than that in 2012 as shown in Comparative Hydrographs of river Niger and Benue at Lokoja (Fig 14.1).

Fig 14.1: Comparative Hydrographs of Rivers Niger and Benue at Lokoja
 Source: NHSA (2018)

14.2 Impacts of the 2018 Flood Disaster on Agriculture

14.2.1 Loss of Cultivated Crops to Floods during 2018 Wet Season

A) Rice

The cropped area for rice destroyed and the estimated output values for the states visited during the survey are presented in Table 14.1. From the table, all the 9 states visited incur severe damage of rice fields, resulting in loss of crop value ranging from hundreds of millions to even billions of Naira. The highest loss incurred was in Kebbi State where 113,333ha of paddy was with estimated yield value of N28,931,134,264 BN were submerged by the flood and completely wiped away. This was followed by Niger state with a paddy yield loss value of N6, 347,511,558BN. The lowest yield value loss of paddy rice (N236, 078,743M) was from Delta State.

Table 14.1: Loss of cultivated rice to floods during 2018 wet season

S/N	State	Crop area affected (ha)	Estimated yield lost (MT)*	Estimated yield lost value (N)*
1	Adamawa	4097.5	7085.22	956,505,304
2	Bayalsa	20,000	37497.89	5,062,214,492
3	Delta	1000	1748.73	236,078,743
4	Ebonyi	31120	65974.40	8,906,544,000
5	Jigawa	NA	NA	NA
6	Kebbi	113,333	214,304.7	28,931,134,264
7	Kogi	15,000	28,314.31	3,822,431,426
8	Niger	20,000	47,018.60	6,347,511,558
9	Rivers	NA	NA	NA

B) Cassava

Data on estimated loss of cassava produce due to floods in the states visited during the survey is presented in Table 14.2. From the table it can be seen that severe damage was done to the crop commodity by the floods in all the states visited, as a result of loss of hundreds of thousands of hectares of the crop commodity. The highest value loss of the commodity was incurred in Rivers State where more than 70BN worth of cassava was lost to flood. This was followed by Ebonyi state with loss of more than 44BN. The lowest incurred loss of cassava among the states surveyed was in Adamawa, which was about 70MN.

Table 14.2: Loss of cultivated cassava to floods during 2018 wet season

S/N	State	Crop area affected (ha)	Estimated production lost (MT)*	Estimated production lost value (N)*
1	Adamawa	100	587	70,440,000
2	Bayelsa	42,150	134,295	16,511,572,591
3	Delta	9500	71,373.95	5,376,599,932
4	Ebonyi	62242	365,360.50	44,921,078,393
5	Jigawa	NA	NA	NA
6	Kebbi	5,667	26,122.6	3,819,908,190
7	Kogi	120,000	1142.11	140,422,905.2
8	Niger	5,000	21,046.19	2,587,629,560
9	Rivers	100,000	573,689.8	70,535,155,754.

C) Maize

For maize crop, the cropped area destroyed and the estimated output values for the states visited during the survey are presented in Table 14.3. From the table, severe damage of maize fields was seen to be incurred in all the 9 states visited, resulting in loss of crop value ranging from hundreds of millions to even billions of Naira. The highest loss incurred was in Kebbi State where 90000ha of maize farms with estimated yield value of more than N35BN were submerged by the flood and completely wiped away. This was followed by Niger state with a paddy yield loss value of about 3BN. The lowest yield value loss of maize was about N4MN from Delta State.

Table 14.3: Loss of cultivated maize to floods during 2018 wet season

S/N	State	Crop area affected (ha)	Estimated yield lost (MT)*	Estimated yield lost value (N)*
1	Adamawa	5758	12,548.1	2,258,658,718.73
2	Bayelsa	NA	NA	NA
3	Delta	NA	NA	NA
4	Ebonyi	14004	28008	2,594,100,960
5	Jigawa	NA	NA	NA
6	Kebbi	7,000	14,393.22	2,590,779,431.34
7	Kogi	90,000	216,711.6	35,603,552,039.61
8	Niger	12,000	31,448.98	2,912,804,527.41
9	Rivers	20.61	44.92	4,160,404.56

D) Sorghum

Flood damage data on sorghum during the survey is presented in Table 14. 4. From the table, it can be seen that most of the state could not provide data. This could be because at the time of the floods, sorghum fields were not ready for harvest and also, the crop has the capacity to resist flooding effect for some days. However, data from the states with available information showed that Kebbi State incurred the highest loss of sorghum due to flooding. This is as seen with the loss in value of the commodity in tune of more than 2BN. This was followed by Niger State with loss of more than 1BN. Adamawa State was the least hit with loss of the commodity to flood to a tune of 176MN.

Table 14.4: Loss of cultivated Sorghum to floods during 2018 wet season

S/N	State	Crop area affected (ha)	Estimated yield lost (MT)*			Estimated yield lost value (N)*
1	Adamawa	1132.5	1260.66			176,491,897.80
2	Bayalsa	NA	NA			NA
3	Delta	NA	NA			NA
4	Ebonyi	NA	NA			NA
5	Jigawa	NA	NA			NA
6	Kebbi	10,000	12258.45			2,819,444,233.57
7	Kogi	NA	NA			NA
8	Niger	7, 500	11157.59			1,133,722,789.74
9	Rivers	NA	NA			NA

E) Yam

Data on estimated loss of yam produce due to floods in the states visited during the survey is presented in Table 14.5. From the table it can be seen that severe damage was done to the crop commodity by the floods in all the states visited, as a result of loss of hundreds of thousands of hectares of the crop commodity. The highest value loss of the commodity was incurred in Kogi State where more than 250BN worth of cassava was lost to flood. This was followed by Rivers state with loss of more than 34BN. The lowest incurred loss of yam among the states surveyed was Delta, which was more than 1BN.

Table 14.5: Loss of cultivated yam to floods during 2018 wet season

S/N	State	Crop area affected (ha)	Estimated production lost (MT)*	Estimated production lost value (N)*

F) Estimated Financial Impact of Flood on Crop Production

The table below shows the estimated production losses in naira for some major crops as affected by flood in some states of the federation. Yam has the highest amount lost to flooding with about 346.712 billion naira followed by cassava (N143.962b).

Table 14.6: Estimated Production Losses of Crops in million Naira

State	Rice Production Losses(Naira)	Cassava Production Losses (Naira)	Maize Production Losses (Naira)	Sorghum Production Losses(Naira)	Yam Production Losses(Naira)
Adamawa	956,505,304	70,440,000	2,258,658,718.73	176,491,897.80	NA
Bayelsa	5,062,214,492	16,511,572,591	NA	NA	28102587745.14
Delta	236,078,743	5,376,599,932	NA	NA	1303567519.11
Ebonyi	8,906,544,000	44,921,078,393	2,594,100,960	NA	10,174,737,600
Jigawa	NA	NA	NA	NA	NA
Kebbi	28,931,134,264	3,819,908,190	2,590,779,431.34	2,819,444,233.57	NA
Kogi	3,822,431,426	140,422,905.2	35,603,552,039.61	NA	250167140197.23
Niger	6,347,511,558	2,587,629,560	2,912,804,527.41	1,133,722,789.74	22579685254.71
Rivers	NA	70,535,155,754.	4,160,404.56	NA	34385165710.18
Sub-Total	54,262,419,787	143,962,807,325	45,964,056,082	4,129,658,921	346,712,884,026
Total	595,031,826,141				

The estimated loss for the mentioned crops alone as shown in the pie chart below stands at 595.032 billion naira with yam having the largest share of loss (58 %) followed by cassava with 24 percent and sorghum having the least percentage (1%) of the total value of crops affected by floods (Figure 14.7). This by implication indicates a serious challenge on the socio-economics of the populace.

14.2.2 Livestock

Table 14.7 shows the estimated losses in cattle for states affected by the flood. Kebbi State lost 1,000 cattle, Niger state lost 856, Adamawa 126, while Kogi lost 90. The estimated monetary value of cattle lost was highest in Kebbi state (N100,000,000), followed by Kogi (N19,000,000) while in Niger state, N102,720 was lost.

Table 14.7: Estimated Livestock Losses- Cattle (Naira)

	State	Estimated number lost	Estimated value lost (N)*
1	Adamawa	126	9,450,000
2	Bayelsa	NA	NA
3	Delta	NA	NA
4	Ebonyi	NA	NA
5	Jigawa	NA	NA
6	Kebbi	1,000	100,000,000
7	Kogi	90	19,000,000
8	Niger	856	102,720
9	Rivers	NA	NA

The estimated losses in donkey and camel is revealed in Table 14.8, Kebbi state lost 52 camels which is equivalent to 4,600,000 naira. Other states had no such records for donkey and camel.

Table 14.8: Estimated Livestock Losses- Donkey/Camel (Naira)

	State	Estimated number lost	Estimated value lost (N)*
1	Adamawa	NA	NA
2	Bayelsa	NA	NA
3	Delta	NA	NA
4	Ebonyi	NA	NA
5	Jigawa	NA	NA
6	Kebbi	52	4,600,000
7	Kogi	NA	NA
8	Niger	NA	NA
9	Rivers	NA	NA

Table 14.9 shows the number of sheep and goat lost in the states visited. Rivers state lost the highest number of sheep and goat (63,000), followed by Kebbi (4,300), Kogi (3,800), Adamawa (2,171), Delta (2,000), and lastly Niger state (1,070). Similarly, Rivers state had the greatest economic loss (603,000,000), followed by Kogi state (N47,000,000), Kebbi (N44,000,000), then Adamawa (N32,565,000) and lastly Delta state (20,500,00). Data from the other states were not available.

Table 14.9: Estimated Livestock Losses - Sheep/Goat (Naira)

	State	Estimated number lost	Estimated value lost (N)*
1	Adamawa	2,171	32,565,000
2	Bayelsa	NA	NA
3	Delta	2000	20,500,000
4	Ebonyi	NA	NA
5	Jigawa	NA	NA
6	Kebbi	4300	44,000,000
7	Kogi	3800	47,000,000
8	Niger	1070	11,070,000
9	Rivers	63,000	603,000,000

The estimated losses in poultry is revealed in Table 14.10. Bayelsa had the greatest loss (8,000,000), then Rivers (100,000), Delta State (30,000), Kebbi was next (6,500), followed by Adamawa (4,405) and Niger (3,462) lastly, Kogi (50). The estimated economic losses in poultry was highest in Bayelsa (N2,400,000,000), followed by Rivers (N103,000,000), Delta (N40,500,000), Kogi (N20,000,000), Niger (N5,139,000), Adamawa (N4,666,500), however, Kebbi had the least (N3,550,000).

Table 14.10: Estimated Livestock Losses-Poultry (Naira)

	State	Estimated number lost	Estimated value lost (N)*
1	Adamawa	4,405	4,666,500
2	Bayelsa	8,000,000	240000,000
3	Delta	30,000	40,500,000
4	Ebonyi	NA	NA
5	Jigawa	NA	NA
6	Kebbi	6,500	3,550,000

8	Niger	3,462	5,139,000
9	Rivers	100,000	103,000000

Table 14.11 shows the losses in swine production in the states visited. Bayelsa state lost the highest number (37,000), followed by Rivers (20,000), Delta (4,000), then Adamawa (1,281). The equivalent economic losses in the four states was N2,400,000,000, N200,000,000, N30,100,000 and N23,058,000, respectively.

Table 14.11: Estimated Livestock Losses in Swine (Naira)

	State	Estimated number lost	Estimated value lost (N)*
1	Adamawa	1,281	23,058,000
2	Bayelsa	37,0000	2,400,000,000
3	Delta	4,000	30,100,000
4	Ebonyi	NA	NA
5	Jigawa	NA	NA
6	Kebbi	NA	NA
7	Kogi	NA	NA
8	Niger	NA	NA
9	Rivers	20,000	200,000,000

The estimated losses in the three major (3) Livestock species in million naira are revealed in Table 14.12. Kebbi had the highest economic loss (N100,000,000) in cattle, while Rivers state had the highest economic loss in sheep and goat (N603,000,000) while Bayelsa state had highest economic loss in poultry (N19,000,000,000).

Table 14.12: Estimated Livestock Production Losses (Naira)

	State	Cattle	Sheep/Goat	Poultry
1	Adamawa	9,450,000	32,565,0000	4,666,500
2	Bayelsa	NA	NA	19,000,000,000
3	Delta	NA	20,5000,000	40,500,000
4	Ebonyi	NA	NA	NA
5	Jigawa	NA	NA	NA
6	Kebbi	100,000,000	44,000,000	3,550,000
7	Kogi	19,000,000	47,000,000	20,000,000
8	Niger	102,720	11,070,000	5,139,000
9	Rivers	NA	603,000,000	103,000,000

The implication of these results is that there may be a shortage in animal protein in the year 2018. Therefore, it is recommended that all levels of government (federal, state and local) should massively invest in livestock production that have short generation interval and rapid return upon investment such as poultry and rabbit. Also, the Federal, State and Local government should engage in crop production which will supply alternative sources of protein such as quality protein maize (QPM) and soybean fortified with lysine.

Plate 14.9: Small size fish catches overr flooded river at Miga LGA

Generally, fisheries sector in selected states suffered serious devastation as most fisheries activities take place around riverine areas. The 2018 flooding effect in many states indicated high losses e.g. in Bayelsa state the lost incurred on earthen ponds is 105 tones valued at about 2.1 Billion Naira, while the concrete ponds loss was 77.5 tones with the estimated value of 1.8 Billion Naira. In Kebbi state generally, the losses incurred in the sector covering both earthen and concrete ponds were estimated to cause about one hundred and fifty million Naira (N150,000,000), this includes loses incurred in both artisanal and culture fish productions. Reasons for the losses was that most people in aquaculture and fisheries business are settled along riverine area. Similarly, flood effect this year had an impact on fisheries activities of fish farmers at Ebonyi state. A loss of 50 tones and 20 tonnage valued at N50,000,000 and N500,000 on concrete and earthen ponds were recorded across the state respectively. Incidentally, in Kogi state, the losses incurred were valued to reach about two hundred and fifty million naira (250,000,000) in all the two major sectors. In Rivers state, flooding effect on fisheries and aquaculture indicated that loses were incurred mostly in the earthen pond facility. An estimated loss of 1.7 tones was incurred estimated to cost N720 million. Many states were not reported because the records as at the time of this survey were not available.

Plate 14.13: Flooded Rice Farm and Access Road in Koso Village, Lavun LGA

14.3 Effects on Income

Table 14.16 shows information on number of day lost and the value of losing these days in various states visited. Information on number days lost by farmers due to flood was obtained from three out of the six states visited. The highest number of days lost was reported by Niger state (70 days) followed by Kebbi (65 days). This was attributed to the vast rice fields affected in these states that made farmers to be at home for longer period of time up to the time of this survey. Adamawa and Delta states farmers lost 30 and 26 days respectively due to flood in their states. Lower days lost in Adamawa and Delta was due to the fact that most of their farm works were done before the flood in the states. The recommendation to compensate these lost days and income by farmers is to support them to be engaged in dry season farming.

Table 14.16: Impact of the Flood Disaster on Employment and Income in the Agricultural Sector (Estimate)

State	Working days lost in crop production	Income loss by workers in crop production (million naira)	Working days lost in Livestock and fisheries	Income loss of workers in Livestock and fisheries (million naira)	Total working days lost in agriculture	Total income loss of workers in agriculture	Number of Drowned Animals Due to the 2018 Floods- cattle, goat/ sheep, pigs, poultry

The impact of flood on farmers nationwide cannot be over emphasized. Most of the states supplied relief materials to victims in various ways. Some of the materials supplied include food items, building materials, agricultural inputs, medication, transportation and households. Tables 14.14 to 14.16 indicate the types, quantity, source and adequacy of the relief materials supplied by the states. Most of the relief materials were supplied by state government through state emergency management agency (SEMA). Other sources of supply were National Emergency Management Agency (NEMA) and Non-Governmental Organizations (NGOs). Almost all the states reported that the relief materials were not adequate but still more were expected to be given which reduces the hardship flood victims were facing.

14.5 Summary on Flood Occurrences and Effects

All the communities visited are lacking emergency preparedness, adequate health services, poor access roads and hygiene. Most pronounce are lack health facilities, poor drainages and awareness on preventive measures.

Flood affects almost all the states of the federation but the impact differ from one state to another. The damages caused by flood is more in the states that are along the plane of river Niger and the most affected crop compared to other crops was rice for which large area of land was destroyed. This survey also discovered that a part from planted rice fields, nursery beds in preparation for dry season farming with plenty of rice seedlings were destroyed by the flood. The survey teams were informed that the cause of the flood in most states was due to rainfall intensity experience in 2018, because there was no report of releasing water from Dam except in Adamawa where it was reported that water was released from a Dam in Cameroun. Rainfall experienced this year has made crops to grow better than last year but the yield increase due to better rainfall cannot compensate the loss due to flood damage. Concrete measures need to be taken by government to avoid food scarcity that might be caused by the lost due to flood. Flooding this year consumed a vast agricultural land destroying about 35% of agricultural land in most of the states affected. Majority of the affected areas have not been given any assistance.

It was reported that victims of the flood are getting over the situation gradually, some are returning to their farm lands to take advantage of residual moisture, while the fishermen are returning to their fishing activities as expected when the flood recedes. However, victims whose houses were completely destroyed have to remain the IDP camps for a while, while they seek the assistance of the state Government to help them return to their normal activities. In conclusion, governments at all levels should take a drastic measure to prevent occurrence of flood, assist the victims and also purchase surplus grains produced from non-flooded areas and keep in their grain reserves in order to avoid food scarcity in the country as food security measure.

Fishermen and women suffered loses which could draw their activities back if not assisted. It is recommended that assistance such as fishing gears, canoes, cages, fish feed, fingerlings, fish smoking kiln and packaging materials be given to the fishers. Government needs to enforce legislation to safeguard lives of fishers by resettling them further away from the flood plains. Fish culture facilities such as collapsible tanks, feed and fingerlings be provided immediately as relief materials to reduce the pains of the devastation and make up for the food gaps flood might have created.

14.6 Specific Recommendations for reducing the Impacts of Floods on Farmlands

1. State governments should provide early maturing and drought tolerant seeds to farmers, so as to take advantage of the residual moisture after flooding.
2. Federal government should massively invest in dry season irrigation farming to argument food productions.
3. The Federal government should limit exportation of food crops to neighboring countries to avoid food scarcity due to flood.
4. The Federal /State government should construct dams to accommodate excess water from the River as well as reduce sedimentation of dams, eg water withholding dam at Dasin Hausa in Furore Local Government of Adamawa State.
5. Federal and state Governments is encouraged to timely mop up excess food produced, into its warehouses (grain reserves) and sell to people at a subsidized price during scarcity.
6. Federal and State ministries of Water Resources, Water Basin Authorities, should strengthen necessary structures for flood emergency preparedness and response, flood assessment and prediction. Emergency need assessment, identification and registration of victims should be done immediately after incidents.
7. There should be shelter support and provision of medication to victims in the flooded areas.
8. Relevant MDAs should carry out sensitization on climate change and consequences in the country on flood disaster riverine areas.
9. Rice farmers should be encouraged to plant flood resistant varieties and Government should assist to reduce losses incurred by farmers

26	Rivers	Port Harcourt, Obio AKpor LGA (yigbo, Old Ahoada, Nkpohu- Rumuigbo, Obiwali Rd, Rumuekini)	- Heavy floods				- Thousands displaced - Millions-worth property destroyed	Daily Trust Newspaper Saturday, September 15, 2018
27	Edo	Udaba, Ofukpo, Agbaburu, Osomegbe, Ukpeko, Ugochi and Anegette	- Overflow of river Niger				- Submerging of farmlands	Daily Trust Newspaper Saturday, September 15, 2018
28	Taraba	Gassol, Ibbi, Lau, Karim Lamido	- Flooding - Heavy rainfall - Release of water from The Lagdo Dam				- Farmlands submerged - Millions-worth crops lost - Bridge collapse in Gassol	Daily Trust Newspaper Saturday, September 15, 2018
29	Kebbi	Bagudo, Shanga, Yauri, Ngaski, Lolo, Dandi and 13 more LGAs	- Heavy rainfall - Flooding from the river Niger		19			Daily Trust Newspaper Saturday, September 15, 2018
30	Niger	Shiromo LGA, Bagudu-Alhaji Umoreu, Rafin Gora, Sani-Farin, Mutum, Mashigi-Gungu, Ungwar Aboki	- Heavy flooding		40		- Millions-worth property destroyed -Submerged farmlands - Over 2,000 persons displaced	Daily Trust Newspaper Saturday, September 15, 2018
31	Delta	Abuta, Otuogu, Akwuebunu LGAs	- Heavy rainfall - Flooding				- Thousands displaced - Houses submerged	Daily Trust Newspaper Saturday, September 15, 2018
32	Kogi		-Flooding				-45,000 people displaced	The Guardian Newspaper Sunday, September 16, 2018
33	Kano	Wudil, Warawa, Garya, Gabasawa	- Flooding		31		- Over 10,000 houses destroyed - Property worth 5 billion Naira destroyed - Farmlands submerged or utterly destroyed	Daily Trust Newspaper Tuesday, September 18, 2018

34	Ogun	Abeokuta	- Flood water			- Submerged houses, shops (750 buildings) - Caps cascaded into ogun river -6,030 persons displaced	The Guardian Newspaper Sunday, 29, 2018
35	Kebbi	Shanga and Yauri LGAs	- Flood			- Farmland submerged (rice farm) - 13,000ha of rice - Shanga - 8,000 ha of rice - Yauri	Daily Trust Newspaper Thursday, August 16, 2018
36	Sokoto	Sabon Birni LGA	- Heavy downpour			- 40 houses destroyed -11km road destroyed -Domestic animals and farm produce were lost	Daily Trust Newspaper Monday, August 27, 2018
37	Kaduna	Kaduna North (Ungwar Pama), Ungwar Romi, Karatudu	- Heavy downpour	2			Daily Trust Newspaper Monday, August 27, 2018
38	FCT	Yaba community in Abayi Area Council	- Torrential rainfall -Overflow of Gurara			- Houses and farmland destroyed - Collapsed bridge	Daily Trust Newspaper Monday, August 27, 2018

15.0 CONCLUSION AND RECOMMENDATIONS

15.1 Conclusion

The 2018 Wet Season Agricultural Performance Survey presents a holistic picture of agricultural activities and development in the country within the reporting period. The results showed general increases in economic activities in the agricultural sector (especially cultivation areas and production estimates). Overall, the study shows that there would be bountiful harvest for most crops in 2018 with exception for rice, sorghum and cassava. The reason for the exception is the recent incidences flood occurrence across the country. The study also found that new lands were being opened up for production with increased gender diversification in agricultural activities. Average crop yields were however still below global and African averages.

Production constraints documented ranged from challenges of climate change, problems of insecurity and militancy as well as poor support for agricultural extension activities. These affected all the sectors of the agriculture value chain (crops, livestock, fisheries and aquaculture, and agro forestry).

15.2 Recommendations

Based on the various observations, findings and challenges from the field, as well as the conclusion, the following recommendations are made:

- 1. The need to revamp extension and advisory activities across the states:** The status and impact of extension activities at the state (ADP's) and local government levels are at critically low status. Government at federal, state and lower levels should develop a strategy for efficient and timely funding of activities of ADPs and other agricultural extension and advisory providers in the country. The government should explore the option of engaging N-Power (Agro) youths in agricultural extension activities to improve the extension system. FMARD should also foster an enabling environment that would allow for public private partnerships and networks to strengthen to extension and advisory activities across the nation
- 2. Options to mitigate the challenges of climate change and floods:** Floods and other impacts of climate change are becoming of increasing occurrence. The Federal government should therefore make increased and sustained investments in flood risk management and advance warning and pre-planning strategies to significantly reduce the impact from flooding. Federal government through relevant agencies may need to introduce water storage areas as well develop a range of temporary or “demountable” defences in at-risk areas. There is urgent need for FMARD and NEMA to work with other relevant agencies to establish an agriculture-based rapid response and think-tank unit to develop a robust masterplan in responses to such monumental occurrences of imbalances to agriculture and the ecosystem. The unit will be responsible, among other things, for developing and promoting coping and mitigation strategies. Food assistance is the main priority need of households in flooded states, the government and the humanitarian community need to ensure that assistance is available to those most in need. The NAERLS along with NHISA and NIMET should be supported to provide information to the general public as well as relevant international and national bodies

on flood risk awareness, flood preparedness, flood risk communication, flood risk management and social vulnerability.

3. **Increased investment in agricultural mechanization to reduce drudgery and cost of labour:** Agriculture in Nigeria still involves utilization hand used tools with attendant high drudgery and low efficiencies. FMARD should intensify efforts using Public-Private Partnership in tractor and input service delivery in the state to boost production and position agriculture in its rightful economic place. There should also be a sustainable strategy to allow for regular acquisition of new tractors and repairs of dysfunctional ones which will allow for incremental increase in production.
4. **Strengthening of e-Extension centres to boost agricultural advisory delivery:** There is need to leverage on recent advances in ICT to bridge the information disconnect to farmers due to the dearth of agricultural extension agents nationwide. FMARD to strengthen the NAERLS for improved use of ICT to cater for the information needs of farmers and other clientele. The National Farmers' Helpline Centres should be given all the necessary support (human and material resources, as well as a conducive policy environment) to be fully operational. Telecom Service providers should be encouraged as part of their national corporate service to support provision of services to farmers through the NFHL by allowing for integration of the NFHL sort code into their respective networks.
5. **The perennial pastoralists/ farmers' conflict has continued unabated over the years.** FMARD work with relevant agencies to develop a strategic plan with specific milestones including a national stakeholder's workshop of farmers, pastoralists, academia, policy makers etc.
6. **Crop and Livestock Data:** The agricultural sector subsector lacks national baseline data with implications on planning and policy. FMARD should work with relevant national and international development partners to advance a strategy for collective action to generate high quality agricultural performance data as well as an innovative and sustainable funding mechanism to support agricultural data generation and management. FMARD should particularly strengthen the capacity of NAERLS, NBS as well as all national and state agencies involved with Agricultural data capture. There is need for capacity building that would allow for increased deployment and utilization of ICT applications, integration of Remote Sensing and GIS Techniques as well as increased utilization of crop simulation models. There is an urgent and critical need for a national livestock census to provide information on livestock population, profiles of livestock farmers and herders.
7. **Cassava glut:** Field reports indicated the wide occurrence of cassava glut particularly in the North Central Zone due to low prevailing market price of cassava. FMARD should develop strategies to create sustained demand for output. This will ensure improved productivity as well as secure demand in industrial and export markets.

NFHL Center at NAERLS

About NFHL

National Farmer's Helpline (NFHL) center is an agricultural based call center that provides farmers with a wide variety of agricultural information and advisory services in real-time. The center is located at National Agricultural Extension and Research Liaison Services (NAERLS), Ahmadu Bello University, Zaria with regional office in each of the geo-political zone of the country.

Why National Farmers Helpline?

Traditional extension services like physical contact with farmers cannot meet the demands of millions of farm families in Nigeria.

However, with the growing penetration of mobile telephony across the length and breadth of the Nigeria, a phone-based extension delivery system will help bring extension services to millions of Nigerians in real-time.

Benefits of National Farmers' Helpline

- Bridge the extension agents-farmers ratio
- Connect farmers to extension enlightenment programmes.
- Provide linkage to all agricultural stakeholders along the agriculture value chain
- Serve as helpdesk to all farmers along agricultural value chain of all commodities

Feature of NFHL

- Coverage-Nigeria, including major mobile networks providers.
- Country-Wide number: **081-3989-0090** or **070-3486-3961**
- Call-forwarding facility with on-site experts
- Provide information to farmers in local languages (Hausa, Igbo & Yoruba).
- Operates from 8:00am to 5:00pm daily. Excluding weekends and public holidays.

NAERLS

VISION

To be foremost institute for agricultural extension research and capacity development for effective delivery services increased agricultural productivity, sustainable agricultural growth and wealth creation.

MISSION

To develop, collate, evaluate and disseminate proven and relevant agricultural innovation and research on extension methodologies and provide leadership in capacity building of stakeholders to meet the present and future agricultural development challenges of the country.
